SIR—The University of Toronto played host to anatomists from the United States and Canada at the fifty third session of the American Association of Anatomists from March 25 to 27. The papers numbered 151, and the subject matter was most varied, representing much that in former generations would have been classed as physiology. Indeed the meetings were attended by many physiologists, biochemists, pharmacologists and others, to whom the morphological point of view and the dynamic interpretations proved of great value. Functional changes in the various endocrine tissues, as revealed by the newest techniques, provided matter for a long list of papers. Other numerous titles were those dealing with blood cells, limb transplantations, development of teeth, the sense organs, and the gonads. It was necessary to sectionalize the programme, and at times five or six papers would be going on at once. Round-table conferences drew together six groups to consider such lively subjects as blood capillaries, neurons, sperm production, and gross anatomical investigations. Much was said about Berger waves and acetylcholine in the central nervous system, indeed H. S. Gasser, director of the Rockefeller Institute, came up to introduce the newer conceptions of the neuron at the round table presided over by Rioch, which ended by viewing the central nervous system either as a 'reverberatorium' or as a 'soup kitchen' with acetylcholine acting as the soup.

Dr. McMurrich, emeritus professor of anatomy in the University of Toronto, addressed the gathering at its annual dinner on the subject of two early Canadian anatomists, and the president of the association, Professor Frederic T. Lewis, delivered an address on "The Fundamentals of Cell Shape." A gracious greeting was sent by Lord Tweedsmuir, the Governor General, which was enthusiastically seconded by President Cody of the University. Among those who spoke at the concluding general session was C. U. Ariens Kappers of the University of Amsterdam.

Altogether the presentations and deliberations afforded a vivid view of modern anatomy, with its emphasis on living animal structure in all its manifold aspects. This science has grown to almost unbelievable dimensions and seems only in its infancy. Seven of the sixty demonstrations were motion pictures—I am, etc.,

London, Canada, March 30

Obituary

Dr. GEORGE HERBERT SPENCER of Jesmond, Newcastle-on-Tyne, died on March 31. He was a native of Austerfield, Yorkshire, and went to school in Doncaster, with which district his family had been associated for many years. A student of the London Hospital, he qualified M.R.C.S. L.R.C.P. in 1900 and practised for some years at Wallsend, after holding house appointments at the Hospital for Sick Children, Newcastle-on-Tyne, at the London Hospital, and the Tynemouth Infirmary. In 1914 he took command of the Military Hospital at Catterick Camp as lieutenant-colonel R.A.M.C.(T) and held that post until the end of the war. Since 1919 Dr. Spencer had practised in Newcastle; he was a member of the local clinical society and of the Northumberland and Durham Medical Society. Dr. Spencer joined the British Medical Association in 1907, and leaves a widow, one daughter, and one son.

Dr. ROBERT MCELROY, whose death took place at his home in Blackhill, Co. Durham, on March 6, at the age of 59 years, was a native of Co. Tyrone and qualified as L.R.C.P.I. and L.M., L.R.C.S.I. and L.M. in 1906. He had been in general practice in Blackhill and district for thirty years and was universally popular with his patients and colleagues. His kindly and sympathetic manner and his unflinching good humour endeared him to his patients. He was a member of the Consett Division of the British Medical Association, Divisional Surgeon to the St. John Ambulance Brigade, and a Freemason. Dr. McElroy was a faithful and loyal colleague who will be greatly missed by his fellow practitioners and a large circle of friends.

Dr. BERNARD SCOTT, who died on March 12 at his residence in Bournemouth at the age of 78, was born in Brighton where his father was in medical practice. He became a medical student at Guy's Hospital at the age of 16 and in 1881 obtained the diplomas M.R.C.S., L.S.A. After holding the appointments of house-surgeon to the Sussex County Hospital and surgeon to the Helen Bridge Alexandra Hospital for Hip Diseases, he joined his elder brother in practice in Bournemouth in 1884, devoting special attention to surgery. In 1892 he was appointed honorary surgeon to the Royal Victoria Hospital, Poole Road, and later to the Cornelia Hospital, Poole. Despite the claims of his large practice, he spared no pains to keep himself abreast of the modern developments in surgery and paid frequent visits to London in order to study the new applications and advances in technique. On retiring from the active staff he was elected consultant surgeon to the Cornelia Hospital. Dr. Bernard Scott joined the British Medical Association in 1890, and was very popular with his colleagues by whom he was highly respected for his skill and great devotion to professional work. He is survived by his wife and nine children, two of whom are in medical practice; one daughter is Elizabeth Scott, the well-known architect.

Dr. ALEXANDER DYCE DAVIDSON, who died at Highgate on March 17, aged 61, was a native of Aberdeen where his father, the late Professor A. D. Davidson, M.D., held the chair of *materia medica*. He studied at the University and graduated M.A., Aberdeen, in 1901, proceeding to the M.B. and Ch.B. degrees in 1904. After serving as house physician and ophthalmic house surgeon at the Aberdeen Royal Infirmary, Dr. Davidson came to London and became senior clinical assistant in the eye department of the London Hospital, ophthalmic examiner of school children under the London County Council at the Deptford Centre, and chief clinical assistant at the Royal London Ophthalmic Hospital. He joined the British Medical Association in 1911, and was a member of the Ophthalmological Society of Great Britain and Ireland.

Dr. BASIL WISEMAN CONWAY of Fallowfield, Manchester, died on March 19. He was a student at Owens College, Manchester, and took the M.R.C.S. and L.R.C.P. diplomas in 1889. After qualifying he acted as house surgeon at the Manchester Royal Infirmary before being appointed medical officer and public vaccinator to the Kirkmanshulme district. He had been living in retirement for some time before his death. He took a keen interest in the Manchester Pathological Society and had been a member of the British Medical Association for forty-one years.

Dr. CECILE BOOYSEN died on April 7, after an illness of five weeks' duration, at the early age of 42. Her father was a farmer in South Africa and she borrowed enough money to come to England to train for medicine, studying at King's College and Charing Cross Hospital. After obtaining the M.R.C.S. and L.R.C.P. diplomas in 1926 she became house surgeon at Charing Cross and then took up general practice in North West London, serving also for a time as clinical assistant at the Paddington Green Children's Hospital and the Royal Free Hospital. In 1936 Dr. Booyesen founded a voluntary birth control clinic known as the Goswell Women's Welfare Centre, in a

very poor overcrowded district of Finsbury. In recent years her interests veered towards Left Wing politics, and after attending the Brussels Peace Conference she started and worked actively for the Medical Peace Campaign. In 1936 she was elected an associate member of the City Division of the British Medical Association, and served as representative of the St Pancras Division at the Annual Meeting at Oxford. She was a woman of outstanding vigour and personality, whose untimely death has caused grief to many friends.

We regret to announce the death at a nursing home in Hove of Dr FREDERICK STAPLETON DICKEY HOGG who was for thirty-five years resident medical superintendent of Dalrymple House, Rickmansworth, a well-known home for inebriates. He was born in India in 1859, the eldest son of Sir Frederick Hogg KCIE and from Repton School went to Jesus College, Cambridge, and thence to St George's Hospital, obtaining the M.R.C.S. and L.R.C.P. diplomas in 1888. After serving as house-surgeon at the West London Hospital he was for a time chief medical officer to the Bengal-Nagpur Railway, returning to England in 1899 to take charge of Dalrymple House Retreat. He was an active member of the Society for the Study of Inebriety and contributed articles on the treatment and control of alcoholism and drug addiction to Quain's *Dictionary of Medicine*, to the *British Journal of Inebriety* and to the *Lancet*. Dr Hogg was a man of charming personality with many friends. He first joined the British Medical Association in 1899.

Dr DAVID SMART of Liverpool died suddenly on April 7 while examining a seaman on a ship in dock at Bootle. He was born in 1860 in Perthshire and from Dundee High School went to Edinburgh University, where he graduated M.B., Ch.B. with first-class honours in 1882, and obtained the B.Sc. in public health four years later. He won the Buchanan Fellowship and held for a time a gynaecological post at the Edinburgh Royal Infirmary. In Liverpool Dr Smart was for thirty-five years visiting medical officer at Smithdown Road Institution, and had also been assistant surgeon to the Hospital for Women and medical officer to the Toxteth Poor Law Hospital. He devoted many years to medical service in the old Volunteers and in the Territorial Army. With Dr Graham Martin he raised the Liverpool Bearer Company some thirty years ago and continued to serve until its members were transferred to field units of the 1st and 2nd West Lancashire Field Ambulances. During the war he was A.D.M.S. to the 57th and 73rd Divisions and retired with the rank of colonel A.M.S.(T). Dr Smart was one of the best known and most popular doctors in Liverpool, and his death is widely regretted.

Universities and Colleges

UNIVERSITY OF BIRMINGHAM

Lectures

A course of five William Withering Memorial Lectures on nutrition and nutritional disorders will be given in the large theatre of the Medical Faculty Buildings, Edmund Street, on April 22 and 29 and May 6, 11 and 13 at 4 p.m. The first lecture will be given by Professor W. N. Haworth, D.Sc., F.R.S., the second and third by Professor J. C. Drummond, D.Sc., and the last two by Professor Leonard G. Parsons, M.D., F.R.C.P. Members of the medical profession and students of medicine are invited to attend. Details of the lectures will be published in the post graduate diary column of the *Supplement* weekly.

The Ingleby Lectures 1937 will be given on Tuesday and Thursday, May 18 and 20 at 4 p.m. in the medical lecture theatre by Professor Arvid Wallgren, M.D. of Gothenburg. The subject of Professor Wallgren's first lecture will be "Erythema Nodosum" and of the second "Childhood infection and Adult Type of Pulmonary Tuberculosis."

Post graduate courses will be held in the Department of Industrial Hygiene and Medicine of the University as follows:

May 24 to June 4, On the Care of the Injured Workman
June 14 to 25 Intensive Course in Industrial Hygiene and Industrial Medicine. The fee for each course is £6 6s., and full particulars can be obtained from Dr H. E. Collier, Department of Industrial Hygiene and Medicine, The University, Edmund Street, Birmingham.

Provisional arrangements are being made for a course in neurology to be given in hospitals associated with the University of Birmingham (May to July) for practitioners desiring to enter for an examination for a Diploma in Psychological Medicine and for others. Further information may be obtained on application to the Dean of the Faculty of Medicine, the University, Edmund Street, Birmingham 3.

UNIVERSITY OF DUBLIN

TRINITY COLLEGE

The following candidates have been approved at the examinations indicated:

FINAL MEDICAL EXAMINATION—Part I (*Materia Medica and Therapeutics, Pathology, and Bacteriology*). *M. Herman, *G. E. Nevill, †F. D. FitzG. Steede, †Isabella M. Dorman, †Fallon, F. H. Counihan, Deborah Bloom, B. Kernoff, H. McV. Buchanan, M. F. X. Slattery, J. L. Mans, J. W. Cathcart, †W. Hanna, J. Morris, N. Marks, Mary A. Conyngham. Part II. M. B. W. Hayes, H. FitzG. Sloan, O. M. Harrison, S. Tomlinson, G. Donald, R. W. Duncan, C. J. S. Flood, Rebecca M. R. Pike, H. M. Carson, F. J. B. Convery, B. Ch. †Eileen D. Maunsell, †J. G. Steinbock, P. J. Mullaney, C. Mushatt, G. C. Reitz, D. S. Toole, F. J. B. Convery, J. G. Cunningham, D. J. H. Douglas, P. L. van Aardt, A. J. Reeves, J. McQuillan, M. Levy, B.A.O. *E. McG. Cochrane, *G. N. MacFarlane, *M. C. Brough, *R. E. Taylor, *H. J. Walker, †W. T. Kenny, †J. C. Lambkin, †J. E. Gillespie, †Stella M. Coen, †C. G. Reilly, †C. Cunningham, †J. A. Strong, †Jasmine Taylor, †F. C. Heatley, †H. F. MacFetridge, M.C. Warnock, F. A. Hanna, A. D. Parsons, R. Pollock, J. Freedman, D. G. Harrison, Grace M. Wild, J. N. G. Drury, Patricia M. J. Conway, J. G. Nixon, J. B. Plews, S. G. Heaton, M. C. Wood, J. H. Mitchell, J. R. Steen, R. Brass, C. M. Ludlow, S. Rubin.

DPH (Part I). *T. A. Austin, *Emily M. Booth, †H. W. Dalton, Mary S. Miller.

DIPLOMA IN GYNAECOLOGY AND OBSTETRICS—†K. Tatz, †M. M. Kneeman, †A. Wassef, V. D. Lespinasse.

DIPLOMA IN PSYCHOLOGICAL MEDICINE—Part II. *H. J. Eustace. *With first-class honours. †With second-class honours.

ROYAL COLLEGE OF SURGEONS OF ENGLAND

A council meeting was held on April 8 with the President Sir Cuthbert Wallace in the chair.

Diplomas and Awards

Diplomas of Membership were granted to Albert Ernest Harpin, Eades Kenneth Coate, Royes and Eric Vernon.

Diplomas in Child Health were granted jointly with the Royal College of Physicians of London to the following candidates:

Margaret D. Baber, H. B. Basu, M. L. Biswas, V. S. H. Davies, J. G. H. Frew, J. H. Green, Joyce B. Jewson, B. Kenton, A. H. M. Kersha, S. K. Lee, G. K. Lim, Louise A. Matheson, Dorothy Miller, A. L. Smallwood, S. E. L. Stening, Elisabeth J. McQu. Thomas, Enid L. Weatherhead, H. A. Williams, Margaret C. Winter, Shuan Shi Yang.

The following Members of twenty years standing were elected Fellows: Ernest Eric Young and Arthur Gorge Wells.

The Jacksonian Prize was awarded to William E. Underwood (St. Bartholomew's). The subject for the Jacksonian Prize for 1938 is: Surgery of the Heart.

The John Hunter Bronze Medal with the triennial prize of £50 was awarded to Laurence F. O'Shaughnessy, M.D., F.R.C.S. for his research work on the surgery of the thorax.

The additional post of fourth house surgeon at the Royal Surrey County Hospital, Guildford, was recognized for the six months surgical practice required of candidates for the final Fellowship examination.

ROYAL COLLEGE OF PHYSICIANS OF IRELAND

At the monthly meeting of the College held on April 2 the following successful candidates at the Conjoint Final Examination with the Royal College of Surgeons in Ireland were admitted to Licences in Medicine and Midwifery:

J. D. Clinch, J. N. Duff, S. Kavanagh, R. M. Kirkpatrick, M. G. Linchan, P. F. Meenan, K. McCaul, I. O'Ryan, T. N. Pilkworth, D. W. Rice, Nora M. Staunton, M. Stein.

The recommendation of the Conference Committee with representatives of the Royal College of Surgeons that a letter be sent to the Minister for Home Affairs of Northern Ireland protesting against the recent Order with reference to the appointment of medical officers in Northern Ireland was adopted.

Medical Notes in Parliament

Business arranged for the House of Lords this week included the Hydrogen Cyanide (Fumigation) Bill and a debate on coroners.

In the House of Commons on April 6 the Prohibition of Vivisection on Dogs (Scotland) Bill, which had been awaiting second reading as a private member's Bill, was withdrawn.

The Contributory Pensions (Voluntary Contributors) Bill was read a second time in the House of Commons on April 8. Replying for the Government, Mr R. S. Hudson said the class affected by the Bill desired pensions and not health insurance. Between 1918 and 1925 45,000 persons became voluntary contributors for health insurance. From 1926 to the present time 650,000 persons had become voluntary contributors for pensions. Anyone who was a voluntary contributor to-day could continue being a contributor for health and for pensions insurance, or could become a contributor for one, dropping the other.

The Public Health (Drainage of Trade Premises) Bill, which has passed the House of Lords was read a first time in the House of Commons on April 8.

The House of Commons read the Ministers of the Crown Bill a second time and discussed difficulties arising out of the civil war in Spain. The Maternity Services (Scotland) Bill was set down for report and third reading. The House also considered the Army and Air Force Annual Bill in Committee.

A report by the Attorney-General on the Liverpool United Hospital Bill was presented to Parliament on April 13. On the same day a standing committee of the House of Commons completed its examination of the Livestock Industry Bill.

The Methylated Spirits Bill, which passed through the Standing Committee on Scottish Bills on April 13 with an amendment affecting surgical spirits, is set down for report stage on April 23, the last day allotted to private Members' Bills. It is not in the first place on that day.

On April 13, on the motion to go into Committee of Supply on the Civil Estimates, Mr Rowson drew attention to the evidence of malnutrition, which he said called for urgent administrative measures to restore and safeguard the physical well-being of the people. Sir Kingsley Wood said he had asked the authorities to review the scale of income observed in connexion with the requirement for repayment for milk or for food supplies. He had also asked the authorities to consider afresh the question of a properly organized system of meals, and he had reason to believe that the authorities would be able to continue and extend the work they were now doing. The Department would undertake certain dietary surveys which the Advisory Committee on Nutrition had recommended. This would take time, but would not stop the work now going on.

In the House of Commons on April 13, on the motion to go into Committee of Supply on the Civil Estimates, Wing Commander James called attention to the need to implement the Report of the Committee on Voluntary Sterilization and moved that, in the opinion of this House, the Government should give further consideration to the potentialities of voluntary sterilization for hereditary defectives in accordance with the unanimous recommendations of the departmental committee that reported to the Minister of Health on January 8 1934. Sir Kingsley Wood said that there was no question that opinion in this country was growing in favour of sterilization, but opposi-

tion remained and there was still much conflict of opinion, particularly on religious grounds. The medical profession was by no means unanimous on the matter. The amendment was withdrawn.

The report of the Charity Commissioners for England and Wales on proceedings during 1936 says of the Voluntary Hospitals (Paying Patients) Act 1936: "In pursuance of the provisions of the Act we made rules in relation to applications for Orders under the Act and other matters on September 15, 1936 and the rules were laid before Parliament as directed by the Act on October 10, 1936. Five applications for Orders under the Act were received by us before the end of the year, but we have reason to believe that several further applications will be received by us in the near future."

Physical Training and Recreation Bill

Mr OLIVER STANLEY in the House of Commons on April 7 moved the second reading of the Physical Training and Recreation Bill. He said the Bill applied to England, Wales, and Scotland and he proceeded to summarize its provisions (which have been previously published). He said that the Government did not desire under this scheme to substitute physical training for games but to supplement games by physical training. Public attention had been concentrated on the scheme from the health point of view. Not so widely known was the remedial effect that wise physical training with a scientific basis behind it could have upon the ills to which a highly civilized and industrialized society was liable. The president of the National Union of Teachers had said that existing machinery could ensure that every school child came to physical training with a well-nourished body. If that machinery was properly used there should be no question of malnutrition in the schools and Mr Stanley assured the House that he intended to impress on local education authorities the need to put the machinery into the fullest operation. The recent revision of the block grant would facilitate this. As for nutrition after school life, the first reports of the Advisory Committee on Nutrition had shown that the picture of a nation suffering from malnutrition was false. It was a problem of a small minority. The Government would carefully consider the remarks made by that committee on the possibility of extending the consumption of milk both in the schools and after children had left the schools. The problem was not only economic but one in which questions of taste and of belief in milk came into play. The trend of industrial commissions was towards shorter working hours and the regular leisure which these would provide would require more active occupation than just sitting about and resting. Physical activity alone was not going to be wholly satisfactory but the facilities provided in the Bill might lead to the development of other and wider interests.

PROBLEM OF NUTRITION

Mr LEES SMITH said the scheme of the Bill was based on the voluntary principle but there was a danger that Government assistance being based upon existing organizations would be given to those organizations which confined their efforts almost entirely to the black-coated workers whereas the greatest need of physical improvement was among factory operatives and those who worked in pits. He did not believe that strenuous physical exercises up to about 25 years of age would guarantee health for the rest of a long life. Lord Dawson of Penn had pointed out that even among Territorials—a group of selected men—50 per cent suffered from physical defects which mere exercises would not remedy. The scheme required not only the development of remedial exercises but development of open air recreation differing in type from violent physical exercise. Mill girls did not need more exercise but quietude and rest in the open air. The attendance of great crowds at football matches was a sign of the instinctive perception of the workers that what they required on a Saturday afternoon was some quiet interest in the open air. Mr Stanley had spoken of the connexion between this scheme and nutrition. The Labour Opposition agreed with the dictum

of Lord Baden Powell that it was no good imposing on underfed and ill nourished boys hard physical exercise. The figures of the Board of Education on the proportion of school children suffering from malnutrition were not reliable. They were based on the impression made upon medical officers of health when they looked at the children. The standard taken by a medical officer of health in looking at children was that to which he was accustomed in the neighbourhood where the school was situated.

Sir FRANCIS ACLAND said that where keep fit classes had been introduced they were a great success and could be provided more cheaply than the football fields, swimming baths and camping sites which were also part of the scheme. Women were at present keener on this keep fit work than men. His experience was that when young men who had engaged in hard manual work went to these classes in the evening they were not too tired to get great refreshment from them.

LADY ASTOR said the standard of health was now much higher but 95,000 children entering the elementary schools yearly were physically defective in some way. Of 100 medically examined children who entered the schools 15 needed medical attention, 15 needed observation, one half showed signs of rickets and two thirds had defective teeth. This could only be remedied by open air nursery schools. A great many of these children needed sleep, fresh air and proper play. Sleep was just as important as food. There were too few nursery schools. The London County Council had not built one.

MINISTER OF PLEASURE

Captain ELLISTON referred to a suggestion by Lord Horder in the House of Lords that there should be a Minister of Pleasure. The Bill made a first step in that direction. In spite of all the provision by clubs and societies, by such philanthropic bodies as the YMCA and by great business houses, 80 per cent of the boys of this country got no regular exercise after leaving school and the case of women and girls was worse. Magnificent pioneer work had been done in Lancashire in providing physical classes for women and girls in every industrial town throughout the country, and the organizers had been assisted by valuable medical advice. Physical training was being exploited by all sorts of cranks without sound knowledge of the physiological considerations. The local committees would require the advice and assistance of trained experts with the highest qualifications, both theoretical and practical. Given the right instructors there would be an immediate response from the people. He was glad the Bill empowered the Treasury to cover the cost of teaching the public the value of physical education. There would be opportunity for the Ministry of Health to include this subject in its coming campaign for educating the people in matters of health. He hoped to see on the gates of all public parks and gardens notices that an instructor would attend to give exercises to those who required them at convenient hours and that a medical man would be attached to these instructional courses to search for signs of malnutrition, to warn persons who were unfitted for violent physical exercise and to suggest to others ameliorative treatment to make them physically fit.

UNIVERSITIES OF SPORT

Mr GEORGE GRIFFITHS said schemes of physical training would be useless for boys between the ages of 14 and 18 working in pits who when they came home dragged themselves along like old men. He went on to cite evidence brought forward by Sir John Orr and Dr McGonigle on the small consumption of milk among the working classes. Sir SAMUEL CHAPMAN said that in Edinburgh a rate was levied for the purpose of meeting the athletic inclinations of young citizens. Four universities of sport should be established in the four great centres of Scotland.

Mr CLEMENT DAVIES spoke of the conditions under which children were educated in rural Wales. Some toddlers of 6 were called before 7 o'clock to walk four miles to school and when they got there there was no means of drying their clothes. At about 10.30 a.m., when they were allowed out they ate every scrap of the sandwiches in their satchels and when they

arrived home between 5 and 6 o'clock they had to help on the farm before a meal was ready for them. Why could not money be provided to help these rural children? Mr TINKER said those whose drudgery continued from early morning till late at night should have their hours lessened so that they could receive the benefits of the Bill.

LORD BURGHLEY said that the majority of the members of athletic teams with whom he had gone abroad were from the class to which Mr Tinker referred and had been placed in the Olympic Games. It was marvellous how working as hard as they did they found time to produce such physical fitness. Of the 150,000 members affiliated to the Amateur Athletic Association the great majority came from these classes. Champions were freaks and the House did not necessarily wish to produce them but to raise the general standard to make people take a pride in their physique, and to make them realize that in all physical fitness and in preparation for sports and recreations happiness was to be found. Mr PILINGTON said that he would like to see the universities have some scheme whereby every undergraduate would partake in physical exercises.

Mr G. A. MORRISON said nutrition was the basic element of physical fitness which also depended on attention to the health of the pre-school child. It depended upon attention to diet, to bodily hygiene, the care of teeth and adequate practice of physical exercises during school life. Of recent years physical exercises founded upon anatomical and physiological knowledge and accurately recorded practice had had a most beneficial effect. He had consulted medical men on this subject and was impressed with the humility with which they said they did not understand all that was involved. Perhaps a new kind of expert was required with medical training and special qualifications in physical training. Attention should be directed to the provision of facilities, accommodation, and apparatus for remedial work before the young persons got too old.

Mr WESTWOOD discussing the application of the Bill to Scotland said nutrition was absolutely necessary to make a success of the Bill and must be extended far beyond the school children. Professor Cathcart, in a speech which was reported in the *British Medical Journal* had emphasized that the problem of food was frequently as much psychological as physiological. Dr Elliot must press the local authorities to use their power to avoid malnutrition through the under-feeding of children in schools. Mr SHAKESPEARE said some 14,000,000 persons between the age of 14 and 35 might come under the Bill. In his own constituency working boys and girls coming out of the factories, however tired they were, tried to engage in some form of exercise such as swimming or gymnastics and if facilities were provided in the manner proposed by the Bill more would make use of them.

The Bill was then read a second time without a division and committed to a standing committee. The necessary monetary resolution was carried through committee without discussion.

Factories Bill in Committee

Major LLOYD GEORGE was again in the chair when a Standing Committee of the House of Commons resumed on April 8 the examination of the Factories Bill. The committee proceeded to consider Part IV—Health, Safety and Welfare (Special Provisions and Regulation).

DUST AND FUMES

On Clause 46 (Removal of Dust or Fumes) Mr RHYDS DAVIES moved to provide that the safeguards of the clause should apply not only to dust or fume but also to other impurity likely to be injurious or offensive to any person employed. He said that in some offensive trades such as those dealing with rabbits skins many impurities arose which could not be said to be fumes or dust. Mr GIFFORD LLOYD said that on further inquiry the Home Office found many impurities which would not strictly be covered by the words in the clause. Fume was defined in Clause 145 as including gas or vapour and would not cover liquid or the fumes of liquids which were given off by spraying from a chromium bath. Other con-

ditions were not sufficiently covered by the word "dust." The Government would therefore accept the amendment. Mr GRAHAM WHITE moved to alter the clause by leaving out the words "or offensive." He said that the governing word in the clause was "injurious." "Offensive" introduced an element of uncertainty. In his first employment as chemist in a factory where there was an ammonia plant on one floor those who worked there liked the aroma and had an idea that it was good for them. Under the clause it would have been necessary to close down that plant. Mr RHYS DAVIES said he was a member of a local authority in whose area was a tripe-dressing factory which was not injurious to the workers but was really offensive and the authority compelled the owner to remove the factory. Mr T. HUNTER asked how the clause would affect a linoleum factory where the continuous smell might be regarded as offensive except by the people engaged in the factory. Sir JOHN SIMON said it was not the smell as such with which the clause was concerned but the dust or fume, and the measures to be taken must be practical measures. The clause talked of dust or fume being offensive to "any person" but that did not mean someone with an idiosyncrasy like people who could not bear cats in the room. He was inclined to recommend the committee to substitute the words "the persons employed for any person employed." Mr WHITE said that alteration would secure what he had in mind. The clause was amended accordingly and Mr RHYS DAVIES's amendment to insert "or any other impurity" was added at the relevant point. The clause as amended was added to the Bill.

WASHING FACILITIES

On Clause 47 (Washing Facilities and Meals in Certain Dangerous Trades) Sir ERNEST GRAHAM LITTLE moved to leave out the word "washing" and to substitute "cleansing," in the provision that in processes liable to cause dermatitis or other eruptions of the skin, and in any rooms where lead arsenic or any other poisonous substance was used adequate and suitable washing facilities should be provided. He said he had to move amendments because as the only doctor in the committee he had received suggestions from the Royal Sanitary Institute and the Society of Medical Officers of Health. He said it was common for patients to show dermatitis and other injuries to the skin caused not by the substances with which they had worked but by the materials used for washing their hands such as strong soda or soap. In many processes special solvents were used and the best way of removing a substance from the hands was to apply the solvent which was used in the process. Washing was always understood as washing with soap and water and the amendment would give a wider choice.

Sir JOHN SIMON said "washing facilities" was an expression well known in the industrial code and must vary according to circumstances. It was better to use it rather than attempt to prescribe a sort of formula. The Home Office threw no doubt on the importance of the medical considerations urged by Sir Ernest Graham Little, but the committee was making a general code, and he thought that "washing facilities" was a phrase which in a proper case would include proper methods of cleansing. Sir ERNEST GRAHAM LITTLE withdrew his amendment.

INTERVALS FOR MEALS

On the subsection forbidding persons to remain during intervals allowed for meals or rest in any room where a process was carried on giving rise to highly siliceous dust or asbestos dust, Mr ALFRED SHORT moved to insert after the word "process" the words "prescribed by regulations made by the Secretary of State." Mr LLOYD said this amendment arose out of a proposal by Mr Short to leave out the word "highly." It would meet Mr Short's point. The Home Office was not satisfied with the words "highly siliceous dust" which might put the danger point too high but was opposed to leaving out "highly" since the clause would then apply to any room in which there was siliceous dust which could be chemically or physically detected. Siliceous dust in minute quantities and harmless from a pathological point of view was present in many workrooms and was probably present in the room in which the committee was then meeting. The committee was therefore forced back on the method of allow-

ing the Secretary of State to prescribe what was a room in which there was sufficient siliceous dust to be dangerous.

The committee accepted the amendment and Mr Short's subsequent amendment to leave out the word "highly." Mr RHYS DAVIES moved to extend the prohibition against remaining in the room during meal time to the taking of food and drink in that room. Mr LLOYD said siliceous and asbestos dust, while dangerous to breathe, was not dangerous to swallow, unless perhaps if taken deliberately by the sackful. It was therefore unnecessary to prohibit workers from swallowing a sandwich or a bar of chocolate or drinking a glass of water during the actual working period. The amendment was withdrawn and Clause 47 was added to the Bill.

SHUTTLE KISSING

On Clause 48 (Shuttle Threading by Mouth Suction) Mr RHYS DAVIES raised the debate by proposing to leave out the provision that regulations made by the Home Secretary on "shuttle kissing" should be special regulations. He said the habit of shuttle kissing which prevailed especially in the Lancashire cotton industry had grown up for the purpose of speed but both employers and workers would like to do away with it. A mechanical device for shuttle threading was shortly coming on the market. His amendment would enable the practice to be abolished once and for all without special inquiry. Mr J. HEPPWORTH said he found most employers in the woollen textile industry provided apparatus for threading the shuttle but the difficulty was to get the employees to use it. In Bradford one employer of 2,000 weavers provided every weaver with an apparatus for threading the shuttle but not one in a dozen would use it. If regulations were made there would have to be a special regulation to compel employees to use the apparatus.

Mr BURKE said there was not as much shuttle kissing in Yorkshire as in Lancashire. Apart from the injury to health it was injurious to the teeth. In Lancashire a condition commonly known as "weaver's teeth" resulted from shuttle kissing. Sir JOHN SIMON said it had not been proved that this practice produced injurious results but he would make inquiry into what Mr Burke had said. The words "special regulations" had been put in in order to get the views of everybody who had knowledge of the subject before the Departments proceeded to make regulations. Sir ALFRED LAW said that in some factories there was no shuttle kissing. He was a member of a firm which made woollen goods and he had not seen anything of the sort. Mr RHYS DAVIES withdrew his amendment on Sir John Simon promising to look into the matter further, and Clause 48 was added to the Bill.

Clause 49 (Prohibition of Use of White Phosphorus in Manufacture of Matches) was added to the Bill without discussion. Clause 50 (Humid Factories) was also added to the Bill with an amendment to deal with the case where combing and spinning were carried on in different rooms.

UNDERGROUND ROOMS

On Clause 51 (Underground Rooms) Mr SHORT moved to vary the conditions on which an underground room used not only for storage or excepted purposes could be certified by the inspector for the district to be suitable for factory use. The clause as drafted provided that the certification should be one of unsuitability. Mr Short said the amendment would bring factories into line with underground bakeries by ensuring that there should be certification for use. Mr LLOYD said that in the clause an underground room meant any room half of which was below the level of the ground. Underground rooms as defined in the clause were not necessarily bad especially having regard to the new provisions for lighting and ventilation. Information in the Home Office indicated that an improvement had taken place: there were good reasons for allowing basement rooms to be used for machinery.

Miss HORSBURGH said in large towns work was done in any number of small underground rooms and in many dressmakers' premises girls worked in underground rooms which were entirely unsuitable. Sir JOHN SIMON said the clause as drafted was in the form in which it appeared in the Factory Bills of 1924 and 1926. It would be a new provision in the law and

an improvement. A general census of underground rooms would take a long time and divert inspectors from other important work. Mr SHORT withdrew his amendment, and Mr SILVERMAN withdrew an amendment to provide that the height of such underground rooms should not be less than 8 feet 6 inches measured from the floor to the ceiling.

Sir ERNEST GRAHAM LITTLE moved to provide that the inspection should be by the district council in consultation with the factory inspector. He said he was advised by the Society of Medical Officers of Health that if the district council was invested with authority the provisions would be carried out. Sir JOHN SIMON said that on questions of unsuitability of the room or inadequacy of ventilation the factory inspector would be the better judge. He hoped the Society of Medical Officers of Health would be convinced that the Bill was better as it stood. The amendment was withdrawn and the clause was then added to the Bill.

BASEMENT BAKE HOUSES

On Clause 52 (Basement Bake houses) Mr BANFIELD proposed to provide that the exemption for existing basement bake houses should not extend beyond five years before the passing of the Act. The clause before the committee had been passed in 1901 when a Factory Bill was under discussion, and Government spokesmen had then said that within twenty years underground bake houses would be abolished. Thirty years had passed and underground bake houses were still numerous, particularly in London. It was now easy to construct baking ovens of steel and the House should say that the time had come when underground bake houses should be shut. Men worked there in an atmosphere of sulphur heat and steam.

Mr LLOYD said it was unlikely there could be evidence to justify prohibition of all basement bake houses five years hence. Bake-houses could only be used under the present law if they were certified by the district council as suitable. The strengthening of the law on new bake houses was to be considered in consultation with the Ministry of Health. Sir JOHN HASLAM, Mr RIOLEY and Mr MANOFF supported the amendment. Sir JOHN SIMON said the matter was important but the amendment had only been printed for the first time that morning and he wished to get his officials to inform him on it. He would like to see an opportunity taken to discourage the continuance of these old underground bake houses. On this assurance Mr BANFIELD withdrew his amendment and Clause 52 was added to the Bill as was Clause 53 (Laundries). Sir JOHN SIMON remarked that laundries were not necessarily factories. An Act of 1907 dealt with laundries as an addition to the general provisions of the Factory Code and that Act applied regulations in respect of ventilation and other matters to all the rooms in the laundries. The clause in the Bill merely proposed additional provisions. The clause was added to the Bill, and the committee adjourned until April 13.

Nutrition and Family Budgets

Mr DUNCAN SANDYS asked on April 8 whether it was the intention of the Government to institute the inquiries into income distribution, family budgets and diet recommended by the Advisory Committee on Nutrition in their recent report in so far as these were not already covered by existing investigations. Sir KINGSLEY WOOD replied that this was intended. The dietary survey had already begun. As regards family budgets it was hoped to obtain information as to food consumption in the course of the inquiry undertaken by the Minister of Labour for the purpose of the revision of the cost of living index number. The method of carrying out the inquiry into diet was receiving consideration.

Sir Kingsley Wood also assured Mr Sandys that recommendations made by the Milk Reorganization Commission for the increased consumption of liquid milk were receiving the Government's careful consideration. He had issued a circular on April 1 to maternity and child welfare authorities inviting attention to the Report of the Advisory Committee on Nutrition and urging them to review their arrangements for the supply of milk in the light of that report. Sir Kingsley further informed Mr Sandys that recommendations made by the Advisory Committee on Nutrition that the consumption

of potatoes should be increased were receiving consideration together with the other recommendations of the committee, but he could not say what further action might be taken.

Animals in Films

In the House of Commons on April 9 Sir ROBERT GOWER moved the Second Reading of the Cinematograph Films (Animals) Bill. He said its purpose was to prohibit production or exhibition of films depicting sufferings of animals or in the production of which suffering might have been caused to animals. Sir Francis Fremantle had pointed out that the Bill in its present form would prevent the exhibition of films to students in medical schools showing experiments upon animals and the result would be that more animals would have to be experimented upon. On behalf of the promoters of the Bill he had agreed with Sir Francis that if the Bill obtained a Second Reading that point would be dealt with in Committee.

Mr GRAHAM KERR said he could not support the Bill. The cinema had become a great factor in biological teaching and investigation. It gave access to the study of living creatures which would not otherwise be accessible and had become extraordinarily useful by its power to interfere with the time factor. If disease cells like cancer cells were examined with a microscope no movement could be seen although they were alive. But it was possible to take moving pictures at intervals and afterwards to run the film through projecting apparatus to show those cells in activity. That way would eventually lead to the full understanding of many diseases. Other movements were so rapid that they could not be followed with the eye but could be studied in the slow motion picture. Everyone even those people who thought experiments on animals justifiable agreed that the more the number of experiments on living animals could be reduced the better. The cinema film gave a method by which they could reduce such experiments.

Col MOORE intervened to repeat the assurance that such experiments would not be impeded by the Bill and said Sir Francis Fremantle representing the medical profession had suggested an amendment meeting every point which Mr Graham Kerr had raised. Mr GROVES said he had witnessed official cruelty to animals under the aegis of the Home Office at Hendon where surgeons made incisions in the belly of calves and the surgeon was followed by a student who rubbed in some pus. This deadly poison was eventually used as calf lymph to perpetrate the practice of vaccination. There was much cruelty involved in the process.

Mr GEOFFREY LLOYD said the Home Office was substantially in agreement with the objects of the Bill. The conditions normally imposed in licences issued under the Cinematograph Act 1909 gave local licensing authorities complete control over the films exhibited in cinemas. The Home Office felt that the existing powers were sufficient and so far as films produced in this country were concerned the ordinary law relating to cruelty to animals could be invoked.

The Bill was read a second time and sent to a Standing Committee.

Health Insurance Referees

On April 12 Mr HUDSON informed Mr Graham White that eight referees had been appointed under Section 90 of the National Health Insurance Act in England and Wales. Their remuneration was a fee not exceeding 10 guineas a day or 12 guineas where a hearing extended beyond seven hours.

Supervision of Nursing Homes

On April 12, Miss RATHBONE asked the Minister of Health if he would institute an inquiry into nursing homes all over the country in view of the many complaints of the inadequate and insufficiently qualified nursing staffs and the insufficient precaution taken in regard to the prevention of infection. She also asked if he had reason to believe that nursing homes were adequately inspected from the point of view of the sufficiency and qualifications of the nursing staff and that adequate care was given to the prevention of infection particularly when maternity patients were taken as well as general medical and surgical cases. Mr HUDSON said that

the attention of local authorities had recently been called to the importance of the adequate supervision of nursing homes in a circular letter of September 30 last. The Minister of Health saw no necessity for a special inquiry.

Medico-Legal Institute

Captain G. S. ELLISTON asked on April 8 whether in accordance with the recommendations of the Advisory Committee on the Scientific Investigation of Crime it was proposed to establish a medico-legal institute for pathological research and as a training centre for experts in medical jurisprudence. Sir JOHN SIMON replied that the committee's report was primarily concerned with measures for improving medical education in certain directions. He was in sympathy with the recommendations but these fell also within the province of the Minister of Health, with whom he was in consultation. The committee's proposals would involve a substantial charge upon the Exchequer.

Medicine Stamp Duties

On April 6 Sir ROBERT BIRD asked the Chancellor of the Exchequer whether he was aware of the great anxiety felt by those members of the Pharmaceutical Society who were engaged in trade over the recommendations in the report of the Select Committee on Medicine Stamp Duties and whether it was his intention to introduce legislation implementing the recommendations wholly or in part. He also asked what steps it was intended to take to terminate the loss to the revenue consequent upon the avoidance of the payment of medicine stamp duties disclosed in the report.

Mr CHAMBERLAIN said that due weight would be given to all relevant considerations in connexion with the committee's report, but he was unable at present to make any further statement on the matter.

Animal Experiments Without Licence—Mr WM LEACH asked on April 8 whether the Home Secretary had come to a decision whether the case mentioned in the annual return of experiments on living animals in the year 1935 of an experimenter who performed some inoculation experiments without the necessary licence and certificate was or was not in contravention of the Act, for which a penalty not exceeding £50 could be imposed. Sir JOHN SIMON in reply said the nature of this case was stated in the passage of the return to which Mr Leach referred. It was carefully considered whether there should be a prosecution but in all the circumstances, it was decided that the appropriate course was to suspend the granting of the licence for which application was made for six months.

Silicosis in Coal Miners—Mr JAMES GRIFFITHS on April 8 asked what progress had been made by the Medical Research Council in its investigations into the problem of silicosis and other lung disease among coal miners and when the investigation would be completed. To this question Mr RAMSAY MACDONALD answered that the standing committee appointed by the Medical Research Council to direct research into disease of the lungs among industrial workers had already promoted several investigations into silicosis and other conditions. The results had been published in official reports and scientific papers. These researches were in most cases not specially directed to the particular problem of lung disease among coal miners, but during recent months attention had been concentrated on this and a scheme of intensive investigation had been initiated in South Wales. The work already done showed the problem to be one of great difficulty and complexity and the investigation was not likely to be completed in less than two years.

Nursery Schools—Mr SHAKESPEARE told Mr LEONS on April 12 that eighty-six nursery schools were recognized by the Board of Education, of which eighty-three were recognized for purposes of grant, and three as efficient but not in receipt of grant. In addition thirty-four proposals for new nursery schools had been approved in principle and in a number of these cases final plans had been approved by the Board. Seven proposals were at present under consideration.

Medical News

A meeting of the Chelsea Clinical Society will be held at the Hotel Rembrandt, Thurloe Place, S.W. on Tuesday, April 20 at 8.30 p.m. when Mr E. Rock Carling will open a discussion on 'The Doctor and his Dependents'. The meeting will be preceded by dinner at 7.30 p.m.

At the meeting of the Royal Microscopical Society to be held at B.M.A. House, Tavistock Square, W.C., on Wednesday April 21 at 5 p.m. Dr E. S. Horning and Mr K. C. Richardson will present a paper illustrated with colour cinematograph film on 'A New Tissue Culture Technique'.

The Rt. Hon. A. Duff Cooper, Secretary of State for War, will speak on 'The Psychology of the Army' at a public luncheon on Thursday April 22, at the Princes Restaurant, Piccadilly, W. The luncheon is one of a series organized by the National Institute of Industrial Psychology, Aldwych House, W.C.2.

At a meeting of the Royal Sanitary Institute in the Tudor Barn, Well Hall, Pleasance, Eltham, on Friday, April 23 at 5.45 p.m., a discussion will be held on the provision of open spaces.

The inaugural meeting of the Greater London Provident Scheme for District Nursing will be held at Grocers' Hall, Princes Street, E.C., on Monday, April 19 at 4 p.m. The Earl of Athlone will preside and the speakers are Lord Horder, chairman of the council and Miss Wilms-hurst, general secretary of the Queen's Institute of District Nursing. The Scheme aims at providing an organization self-sufficient and auxiliary to various district nursing services in the metropolitan area. The object of the meeting is not to make any appeal for funds but to arouse interest.

The congress known as Journées Médicales de Paris will be held under the presidency of Professor Carnot from June 26 to 30, when hormones and endocrine treatment will be the subject for discussion. The subscription is 50 francs. Further information can be obtained from La Revue Médicale Française, 18, Rue de Verneuil, Paris 7e.

The attention of overseas members of the University of London Medical Graduates Society is drawn to the fact that the annual dinner will take place in the new buildings of the University, Bloomsbury, W.C.1, on Thursday May 6, at 7.15 for 7.45 p.m. It is hoped that as many as possible will be present, particularly as this is the first occasion on which the annual dinner is to be held in the new buildings. Members may bring guests, who may be medical or non-medical and who need not be graduates of any university. Applications for tickets should be made to the secretary, 9 Hardinge Road, London, N.W.10 if possible before April 29. The price of the ticket is 12s. 6d., exclusive of wines and a remittance, made out in favour of Mr Philip H. Mitchiner, M.D., M.S. should accompany the application.

An exhibition of water-colour drawings of game birds, duck, etc. from Iceland, Scotland, the Fens and Brecks by Dr E. A. R. Ennion will be on view at the Greatorex Galleries, 14 Grafton Street, W., until May 15.

A national industrial safety conference is being held this week-end at Balliol College, Oxford, under the auspices of the National Safety First Association, whose office is at 52, Grosvenor Gardens, S.W.1. The main subject for discussion is 'Training Young Workers for Safety'.

It is announced that the St. George's Hospital fever clinic reopened on March 30. Already 500 applications for treatment have been received, and no more can be considered at present. Last year 243 patients were given three treatments each.

The *Practitioner* for April is a special number containing articles on The Use and Abuse of Drugs and Preparations

The March issue of *Le Sud Médical et Chirurgical* is devoted to paediatrics and the issues of *Le Bulletin Médical* for March 27 and of *Paris Medical* for April 3 to gastro-enterology. The issue of the *Medizinische Klinik* for April 2 is devoted to skin and venereal diseases. The issue of the *Wiener medizinische Wochenschrift* for April 3 which is devoted to modern paediatrics, is dedicated to Professor Julius Zappert whose portrait it contains on the occasion of his seventieth birthday.

The 100 000-franc prize associated with the name of Albert I of Monaco has been awarded by the French Academy of Medicine to Dr Paul Boun and Dr Ancel whose work in collaboration on the sex hormones and on the interstitial glands in man is well known.

Professor Levaditi of the Pasteur Institute in Paris and a member of the French Academy of Medicine has been appointed by the Executive Committee of the French League against Venereal Diseases as scientific director of the Alfred Fournier Institute.

Professor Archibald Young and Dr J G McCutcheon have been appointed Deputy Lieutenants for the County of the City of Glasgow.

Dr L Montanari of Parma who recently celebrated his 104th birthday is in good mental and physical health.

Letters, Notes, and Answers

All communications in regard to editorial business should be addressed to THE EDITOR BRITISH MEDICAL JOURNAL BMA HOUSE, TAVISTOCK SQUARE, W.C.1.

ORIGINAL ARTICLES and LETTERS forwarded for publication are understood to be offered to the *British Medical Journal* alone unless the contrary be stated. Correspondents who wish notice to be taken of their communications should authenticate them with their names not necessarily for publication.

Authors desiring REPRINTS of their articles published in the *British Medical Journal* must communicate with the Financial Secretary and Business Manager British Medical Association House, Tavistock Square, W.C.1 on receipt of proofs. Authors overseas should indicate on MSS if reprints are required as proofs are not sent abroad.

All communications with reference to ADVERTISEMENTS as well as orders for copies of the *Journal* should be addressed to the Financial Secretary and Business Manager.

THE TELEPHONE NUMBER of the British Medical Association and the *British Medical Journal* is EUSTON 2111.

THE TELEGRAPHIC ADDRESSES are
EDITOR OF THE BRITISH MEDICAL JOURNAL *Attology*

The address of the BMA Scottish Office is 7 Drumsheugh Gardens, Edinburgh (telegrams *Associate Edinburgh*), telephone 24361 (Edinburgh) and of the Office of the Irish Free State Medical Union (I.M.A. and B.M.A.) 18 Kildare Street, Dublin (telegrams *Bacillus Dublin* telephone 62550 Dublin).

QUERIES AND ANSWERS

Mementoes of Laennec

Dr AGNES F TURNER (County Buildings, Dumfries) writes: I have in my possession a Laennec's stethoscope which belonged to my grandfather with an accompanying booklet of translated extracts from Laennec's work. I should be glad to hear of any museum to which I might send this or any medical or scientific society which would be interested to have it.

Painful Feet

K. D. K. in reply to "Perplexed" (April 3 p. 738) writes: Sponge rubber in soles are used in the orthopaedic departments of many of the London hospitals and by chiropodists. Sponge rubber one-eighth of an inch in thickness is cut to the shape of the sole and brought forward from the heel to the metatarsal heads; a second layer is then placed on top stretching from the metatarsal heads backwards for about two inches—this should be skived anteriorly and posteriorly and fitted with the thickness coming just behind the heads of the metatarsals. The upper surface is then

covered with chamois leather and glued together with some rubber solution (such as is used for mending tyres). These in-soles can be removed from one shoe to another; the suction of the rubber on the under surface prevents any movement in the shoe; the slight thickness under the heel will stop any 'jarring' when walking, and the increased thickness behind the metatarsal heads will remove the excess pressure from the heads.

Oxaluria

Captain C. A. DE CANDOLE R.A.M.C. (Woolwich) writes in reply to "Perplexed" (*Journal* March 13 p. 593). I would suggest that the diet be modified to exclude the following: all fruit and vegetables except cauliflower, lettuce, and apples and even these in minimal quantities; tea, coffee, cocoa, chocolate, jam, pepper and anything containing gelatin. If oxalates continue to be passed in the urine, bread and potatoes should be forbidden and the fruit and vegetables still further reduced. Meat and eggs are permissible. As soon as the urine is free from oxalates, whichever prohibited article is most desired may be allowed and by watching the urine the maximum permissible discovered, others being added one at a time if the urine remains clear. Plenty of fluid may be taken and an alkaline mixture prescribed as by this means the absorption of oxalic acid from the intestine is hindered.

LETTERS, NOTES, ETC

Disclaimer

Professor A. E. NAISH M.D. writes: My attention has been called to recent articles in the provincial lay press in which it is stated that a research group is working at Sheffield University under my direction investigating the treatment of haemophilia. I wish to state most emphatically that these articles have been published without my knowledge and that although I have been associated with the work it is not being done under my direction.

Nutrition and Infectious Disease

Dr J. T. EDWARDS writes: In the report you have published (p. 773) of the discussion on Nutrition and its Effects on Infectious Disease at the meeting of the Comparative Section of the Royal Society of Medicine held on March 24 last I am stated to have said: "It was often observed by veterinary surgeons who had to deal with tuberculosis that high class stock fed and kept in the best conditions suffered more severely than lean beasts when disease was allowed to run its course. The disease dealt with in my paper in this connexion was foot and mouth disease, not tuberculosis."

Ascorbic Acid

In our account last week of the discussion on nutrition and infectious disease Mr A. L. Bacharach was twice reported on page 775 as having mentioned "ascorbic acid." This as he points out is incorrect. The accepted name—by workers in all English speaking countries except the American Medical Association—is ascorbic acid, originally suggested by Professor W. N. Haworth as more convenient than 3-keto-L-gulonolactone, the full descriptive name of vitamin C.

Classification of Serum Proteins

Dr HARRY COKE (London W.1) writes: May I be allowed to point out two slight errors in the report of a meeting of the Committee for the Study and Investigation of Rheumatism on page 778 of your issue of April 10. It was I and not Dr Frank Coke who spoke of the discovery of a new classification of serum proteins by the ultra-centrifugal methods of MacFarlane (*Biochem. J.* 1935, 29, 1175) and the more recent discovery of a very large protein molecule in certain acute conditions. I would wish to re-emphasize that this is entirely the original work of MacFarlane and is a point that was apparently not made completely clear. What I did mention was the confirmatory findings of this from a purely chemical and colloidal point of view.

Medical Golf

The qualifying round of 18 holes medal play in the Noel-out tournament of the Medical Golfing Society was played at Addington on April 8. The following qualified and will compete by match play for the prize: F. McG. Loughnan, J. A. Flaherty, J. Grace, J. D. McGrath, A. G. Palmer, Stanley Wyard, N. L. Eckhoff, Michael Smith and L. Bathurst.

EPITOME OF CURRENT MEDICAL LITERATURE

Medicine

295 Erythema Nodosum in Adults

P. L. ROTNES (*Nord med Tidskr*, February 20, 1937, p. 281) gives an account of 182 cases of erythema nodosum observed in the Ullevaal Hospital in Oslo between 1928 and 1934. The ages of the patients, only nine of whom were males, ranged from 16 to 60, as many as 154 being between the ages of 16 and 30. Tuberculin skin tests were carried out on these 182 patients and on 182 controls—mostly women suffering from various other diseases at approximately the same age. All but ten in the first group proved tuberculin-positive, while seventy-two of the controls were tuberculin-negative. This difference gives support to the view that erythema nodosum is a manifestation of tuberculosis. Even some of the ten tuberculin-negative patients showed evidence of tuberculosis in the form of radiological shadows, a history of pleurisy, etc. The radiological examinations of 181 patients yielded positive findings in 110 cases, which, in twenty cases, were limited to hilar changes. In thirty-three cases there was a history of a sore throat about the time of the eruption, and in as many as seventy-seven cases the erythema nodosum was complicated by ailments of the muscles or joints. In some of these cases the clinical picture was typical of acute rheumatism of the joints. As a rule, the rate of sedimentation was much accelerated and in fifty-six cases there was a dry, hacking cough just before, during, or just after the appearance of the rash. No tubercle bacilli could be found in the sputum or in the skin of the twenty-four patients from whom a little of the tissues involved was removed for microscopical examination. A follow-up study was undertaken at the end of 1934 of 137 patients whose erythema nodosum had appeared from five to eighty-one months earlier. As many as thirty-seven were found to have developed tuberculosis in some form or other—pleurisy in seventeen cases, pulmonary tuberculosis in fifteen, meningitis in two, and various other forms of tuberculosis in the remainder. The author stresses these findings in his advocacy of the close supervision for a considerable time after the appearance of erythema nodosum of patients who develop this disease in adolescent or adult life. For though he admits that erythema nodosum in adults is more often non-tuberculous than it is in children, he considers it a manifestation of tuberculosis in the overwhelming majority of cases.

296 Rectal Absorption of Water

M. TAUBENHAUS and E. AMANN (*Wien klin Wschr*, February 19, 1937, p. 214) have given sodium fluorescein solution rectally in amounts of 20 c.c., and by testing successive specimens of the urine have compared the rate of absorption of water from the rectum in normal and in habitually constipated persons. Since an increased water absorption from the caecum and ascending colon in constipation has long been recognized the writers were surprised to find that severe constipation—whether 'spastic' or 'atonic'—was associated with a greatly diminished rate of water absorption from the rectum. This rate was increased when the constipated subject had been 'cured' by a large-residue-producing diet, was little affected by giving opium to the non-constipated, but was much diminished in normal persons who had been given large doses of calcium carbonate. Alkalinization of acid products of intestinal fermentation would appear to have a decisive influence on the rate of resorption from the rectum.

297 Neurological Findings in Cases of Peptic Ulcer

F. W. KROLL (*Münch med Wschr*, February 19, 1937, p. 281) investigating twenty cases of gastric and duodenal ulcer found in every case some neurological sign or symptom.

These signs were either exaggerated reflexes partly combined with pyramidal symptoms or absent patellar or tendo Achilles reflexes. In addition there were some sensory disturbances in almost every case. These disturbances manifested themselves either in a decrease of the stereognostic sense of the skin or in atactic disorders or rarely in oversensitiveness in the form of Head's zones. There were also often segmental sympathetic disturbances, usually dermatographia, which were either accentuated or decreased between the ninth and tenth thoracic segments. There were also deep sensory disturbances which showed themselves either in an ataxy of the lower limbs or in a positive Romberg's sign. These disturbances never affected the upper limbs. The symptoms were never present singly, but always combined. The author, however, is not certain whether gastric or duodenal ulcer forms part of a disease of the central nervous system or of a metabolic disease.

298 Causes of Death in Diabetics

B. V. BONDORFF (*Finska Läksällsk. Handl.*, January 1937, p. 33) has investigated the causes of the deaths of the 308 diabetics over the age of 15 treated in a hospital in Helsingfors from the beginning of 1930 to October 1, 1936. As many as 120 died within this period. Of the thirty-two deaths under the age of 50 twelve were from diabetic coma, seven from tuberculosis, and four from other infections. The average age at death was 56.5 years, and the average age of the survivors when they were last in hospital was 49.4 years. As great a proportion as 50.8 per cent of all the deaths could be traced to arteriosclerotic changes, heart disease, disease of the cerebral blood vessels and gangrene of the lower limbs. Infectious diseases such as pneumonia, etc., were responsible for 15.8 per cent of all the deaths, and tuberculosis for 10 per cent, while malignant disease disposed of 5.8 per cent. One of the main points in the author's study is that diabetes is very often responsible for sudden 'cardiac' deaths, which are not uncommon even at such a comparatively early age as 30. The author traces many of these deaths to defective circulation in the coronary vessels.

Surgery

299 Complications following Gastro-enterostomy

N. HORTOLOMEI (*Rei Chir*, Paris, January, 1937, p. 19) points out that the operation of gastro-enterostomy is not always successful and that further operation is sometimes necessary on account of persistence of symptoms. The following complications may be seen: a peptic ulcer may develop at the stoma of the gastro-enterostomy or in the jejunum, or there may be stenosis of the stoma. On the other hand, the gastro-enterostomy may be satisfactory without any visible lesion of the pylorus or duodenum or trace of scar. In other cases there may be a scar at the pylorus or duodenum, either of which may be partially or completely stenosed, or again, the stoma may be badly placed towards the left, so that emptying of the stomach is incomplete. In some patients the stoma may be satisfactory but the ulcer still active. In rare instances adhesions may be found round the duodenum and stomach but without any trace of ulcer. In many of these cases the patient suffers either because the gastro-enterostomy was unnecessary or because the stomach contents empty by means of the stoma and also by the pylorus. In many cases the original operation has not cured the condition for which it was undertaken—namely hyperacidity—and symptoms quickly recur. The treatment in these cases is as follows: when there is no demonstrable lesion present the gastro-enterostomy should be undone and this is also satisfactory in cases where

there is the scar of a small healed ulcer causing no stenosis or deformity. In the other conditions a partial gastrectomy should be performed with removal of the pyloric end of the stomach as near the gastro-enterostomy as possible. This operation is much less severe than a gastro-duodenectomy and gives excellent results in suitable cases.

300

Phimosis in Old Men

K. A. LOVEN (*Acta chir scand* January 13 1937, p. 191) has observed in the past two years in a hospital in Upsala as many as five cases of phimosis in men whose ages ranged from 62 to 88 years. This would suggest that such a condition is not very rare but a study of the literature proved almost completely negative. Even bulky urological works ignore this subject completely. The pathology of such phimosis is still obscure and its clinical importance depends mainly on the obstruction it may cause to the passage of urine. Patients with enlarged prostates are particularly liable to be embarrassed by this additional check on micturition which may tip the scales in favour of uraemia. The author finds that phimosis interfering with the micturition of old men is a clear indication for operative treatment. The foreskin should be resected as far back as the coronary sulcus. A less radical operation is liable to be followed by a recurrence of the phimosis and there is an added risk of malignant disease. The detailed notes of the author's cases indicate among other things how varied may be the aetiology of this condition.

301

Pneumococcal Peritonitis

R. PAOLUCCI (*Athena* January 1937, p. 27) who records four illustrative cases in girls aged 4, 5, 6, and 9 years respectively, one of which was fatal, states that 75 to 80 per cent of cases of pneumococcal peritonitis occur in females and almost always between the ages of 3 and 7 years. The thirty cases of pneumococcal peritonitis admitted to the surgical clinic at Bologna in the last twenty years were all in females. This high incidence has been attributed to penetration of infection by the vagina. The principal symptoms are abdominal pain, vomiting, diarrhoea, high fever, herpes, and an early leucocytosis. Operation should be delayed until the appearance of a localized abscess, the mortality being 90 per cent after early operations and only 30 per cent when the operation is delayed.

302

Tibia Vara

W. P. BLOUNT (*J Bone Jt Surg* January 1937, p. 1) gives a review of osteochondrosis similar to coxa plana and Madelung's deformity but occurring at the medial side of the proximal tibial epiphysis. His paper is based on thirteen personal cases and fifteen from the literature on the subject. The condition which may be mistaken for rickets is not limited to the epiphysis but is an abnormality of growth of the metaphysis, epiphyseal cartilage and osseous centre of the epiphysis. In the whole series there were twenty cases of the infantile type of which seventeen were in females. In each case there was a history of normal development with some obesity until the age of 1 or 2 years when an exaggerated physiological bow leg developed. In the adolescent group the onset was between the ages of 6 and 12 years in previously normal children. In no case was there anything in the clinical or x-ray findings to suggest rickets. A congenital factor seems to operate when the deformity appears in the first years of life while in the later groups trauma seems to be the most potent factor with chronic infection as a possible additional cause. In the infantile form the changes consist in faulty growth of the epiphyseal cartilage and delayed ossification of the medial portion of the proximal tibial epiphysis. The adolescent type is due to an arrest of epiphyseal growth rather than a dysplasia and in this group the angulation usually appears only on one side. When the deformity occurs

in infancy a bulbous enlargement of the medial condyle is palpable whilst internal rotation of the tibia on the femur is a constant finding. Recurvatum and relative flat-foot are usually present with shortening of from 1 to 2 cm and abnormal mobility of the knee on medial strain. Spontaneous healing may occur, as in coxa plana and in mild cases symptomatic mechanical relief of the flat-foot and knee strain may be all that is necessary. When the deformity remains stationary osteotomy should be performed after the epiphysis is closed in the late cases. Lasting correction may follow early osteotomy in infantile cases although repeated recurrence may be seen. A guarded prognosis should be given.

Therapeutics

303 Formol Toxoid in Staphylococcal Infections

P. MERCIER (*These Paris* 1937 No. 43) states that selected strains of staphylococci grown on a suitable medium produce a true exotoxin which haemolyses the red cells and causes necrotic lesions in the skin, while intravenous injections of small doses are fatal to rabbits. This toxin however, may be transformed into a harmless "anatoxin" possessing antigenic properties. It has been in use for the last two years at the Hôpital Pasteur, Paris, where it has proved of great value in the treatment of boils, pyoderma, syphilis, ecchyma and whitlows. Its action on acne is usually less definite although some cures have been recorded. It is also of some value in staphylococcal osteomyelitis and septicaemia but further evidence is required before a definite conclusion can be reached on this point. The reactions due to its use are rare and slight. The injections give rise to the appearance of an antitoxin in the serum, which rapidly cures the patient when the antitoxin content of the serum is high. Antitoxic immunity develops very rapidly, often as soon as the second day after injection of formol toxoid. It is only in a very small number of cases such as diabetes and endocrine disorders that antitoxic immunization is contra-indicated.

304

Chronic Tetany

C. FRUGONI and B. DE VECCHI (*Policlinico Sez. Prat.* March 1 1937, p. 413) report a case of chronic tetany in an epileptic man aged 21 who had suffered from typical attacks of tetany since the age of 16. As his condition became worse in spite of treatment and diet a parathyroid gland taken from a girl aged 18 during an operation for goitre was grafted into the right tunica vaginalis according to Voronoff's technique. An immediate cure of the tetany was obtained and lasted eight months when without apparent cause a relapse took place. During the next three months various forms of treatment were applied without success, and then a second parathyroid graft was made in exactly the same way but on the opposite side. As no improvement resulted on this occasion the tissue used was probably not parathyroid as was supposed but only a lobule of fat. A third graft was then made the tissue on this occasion consisting of parathyroid taken from a cynocephalus monkey, and the cure lasted for eight years after which the patient who in the meantime had become tuberculous had a relapse of the tetany and died. The principal finding at the necropsy was the presence in the tunica vaginalis of healthy parathyroid tissue with typical columnar cells. This is the first case on record in which a graft was made by Voronoff's technique for the treatment of chronic tetany.

305

Strophanthin in Angina Pectoris

H. PLÜGGE and E. BIRK (*Dtschr. med. Wschr.* March 12 1937, p. 427) date the modern treatment of angina pectoris with strophanthin from 1931 when Edens published his work on this subject. Since then he and his school have

published 260 cases, and have put the treatment of angina pectoris and cardiac infarcts with intravenous injections of strophanthin on a scientific and rational basis. After giving an account of the rationale of this treatment and emphasizing the need for beginning it before serious hypertrophic changes in the heart have set in, the authors analyse their own experiences with more than eighty cases treated since the beginning of 1935. In most of them compensation was not yet at fault and there was no demonstrable hypertrophy or dilatation of the heart. While Edens as a rule injects 0.4 mg of strophanthin every day for three days and withholds it on the fourth day, the authors usually give smaller doses and individualize very carefully, sometimes giving in the first twenty-four hours as much as 1 mg distributed over four to six injections. Such a high dosage is particularly desirable in cases of recent infarct of the myocardium. The average daily dose in most cases was 0.25 mg and 0.2 mg was often sufficient. A satisfactory procedure is to give 0.1 to 0.15 mg on the first day, 0.2 mg on the second day and 0.3 mg on the third day and to continue a course of injections for four to six weeks. A follow-up study of thirty-two patients showed that twenty-six had been completely or almost completely relieved by this treatment and that some had continued to remain fit in spite of heavy physical work, the relapses were almost entirely among patients who had to do such work. This suggests that treatment in these cases is largely a social problem to be solved by readjustment and easing of working conditions.

Dermatology

306

Lupus and Carcinoma

J MAYR (*Derm Wschr* January 9 1937, p 51) has reviewed 2,725 cases of lupus. Of these roughly 3 per cent developed carcinoma. The mortality among these carcinomatous patients amounted to 1.2 per cent of all cases of lupus. The mean age of the 2,725 patients was 56 years. In some cases the carcinoma appeared thirty years after the appearance of the lupus. Age probably constitutes a contributory factor to the cancerous degeneration of lupus. Facial lupus is particularly prone to degenerate into carcinoma and the x-ray treatment of lupus seems to favour this development.

307

Hysterical Skin Affections

H HAXTHAUSEN (*Brit J Derm Syph* November 1936 p 563) examined the reaction of the skin to mechanical irritants in a group of cases with obvious hysterical lesions or artefacts and in a group of apparently normal individuals. The irritants used were mechanical rubbing, Rumpel-Leede's test radiation with ultra-violet light, freezing with carbon dioxide snow, pricking 1 per cent morphine solution into the skin and pricking 30 per cent silver nitrate solution into the skin. The results proved that using a standard technique there was no appreciable difference in the reactions evolved in either group of cases. Therefore it is reasonable to suppose that the lesions in hysterical cases are the result of pure traumatization of the skin the skin itself being no more reactive in these cases than in normal persons. The degree of traumatization however may be dependent to some extent upon the analgesia so often present in hysterical subjects.

308

Alopecia Areata

In addition to local therapy with ultra-violet light and stimulating lotions H H BAUCKS, C F SIEGMANN and A V KWA (*NY St J Med* November 1 1936 p 1629) recommend the use of small doses of thyroid in the treatment of alopecia areata. They admit that most patients with alopecia areata are not hypothyroid in type but suggest that thyroid administration acts as a slight

stimulant to hair growth. They give once a day a dose of 1 grain of desiccated thyroid equivalent to 5 grains of fresh gland substance. This is continued for two weeks and then doubled for a further two weeks, at the end of which time the dose is reduced again or stopped altogether. As a result of this treatment they noted that new lesions were not so prone to develop in early cases and that hair grew more quickly than when thyroid was not given. Recurrences after cessation of treatment were equally common with or without thyroid medication.

309

Pediculosis of the Eyelashes

A TOURAINE and P RENAULT (*Bull Soc franç Derm Syph* November, 1936, p 1702) report that an infant aged 8½ months was brought to them with intense itching of the free margin of the eyelids of fifteen days duration which had begun one week after its return from a holiday crèche at the seaside. Closer examination showed about a dozen lice adhering to the eyelashes on both lids. Examination with a lens showed them to be of the pubic variety. Only two nits were discovered. The parasites were localized to the eyelashes. There were no parasites or eggs on any other part of the body, the axillae and pubic regions being of course hairless. There were no scratch marks, and there was no glandular enlargement.

310

Ichthyosis and Cryptorchism

O HELLER (*Med Klinik* February 19, 1937, p 271) points out that the differential diagnosis between ichthyosis congenita and vulgaris depends on the time of first occurrence of the condition, the intensity, localization and hereditary tendency. He has found also that ichthyosis vulgaris is not uncommonly associated with cryptorchism, and describes five such cases four of which occurred in children and one in an adult. It is known that the administration of anterior pituitary extract has a beneficial effect on cryptorchism and in these cases Heller found that except in the adult, the skin condition improved remarkably when anterior pituitary extract was given over a period of one to four months. Heller submits two theories to explain this success. (1) Ichthyosis vulgaris may be due to a hypofunction of anterior pituitary which disappears with treatment. (2) An indirect action through the pineal gland is possible. It is known that the pineal gland exerts an influence on cornification in goats and that they grow no horns in the absence of the gland. Hyperfunction of the gland in humans might account for the cornification of the skin. The administration of anterior pituitary extract is thought to balance the pineal hyperfunction.

311

Diathermy in Hypertrichosis

E L LANARI and J CATEULA (*Sem méd B Aires*, December 31 1936, p 1845) state that as hypertrichosis in women is an obvious manifestation of an endocrine disturbance local treatment must always be accompanied by appropriate general measures. Radium and x-rays are definitely contraindicated for depilation of the face, neck, and thorax owing to the dangers resulting from a dose sufficient to cause the permanent death of the hair follicle. Depilatory doses of x-rays are only justifiable in severe cases of cervico-facial hypertrichosis in women in whom the psychical state necessitates a rapid and complete removal of the abnormal hairy growth. The use of x-rays should not be repeated but subsequent hypertrichosis should be treated by diathermy. The writers maintain that diathermic coagulation is the most rapid, efficacious and harmless method of depilation, and is superior to electrolysis in the greater success and rapidity of its action, painlessness of the operation, and usual absence of scarring.

Obstetrics and Gynaecology

312 Polymastia and Polythelia

S DI FRANCESCO (*Ann Ostet Ginec.*, January 31 1937 p 51) states that the occurrence of multiple breasts has been known for many centuries Poppaea Nero's wife, having had three breasts and Anne Boleyn an accessory breast on the thigh The number of accessory breasts is generally one or two rarely three and exceptionally four or five In Gardner's case of a mulatto woman there were six active well-developed breasts situated in the nipple line The inner or outer side of the thigh face lumbar region and labia majora are occasional sites The writer found eleven examples among 3,200 women (3.4 per cent) in the Milan obstetrical clinic but none among 1,010 patients in the gynaecological section of the Ospedale Maggiore Like Testut and Neumann and Ong and in contrast with Schmidt and Kallius and Hirasawa the writer found that the favourite site for both accessory breasts and accessory nipples was below the nipple No special significance can be attributed either to accessory breasts or accessory nipples They bear no relation to the individual development or constitution nor are they associated with maldevelopment of the genitals They may however, be the starting-point of benign or malignant tumours

313 Sarcomatous Degeneration of Irradiated Fibroids

C DANIEL (*Gynec et Obstet* October-December 1936 p 205) reports the case of a woman who had had a uterine fibroid about the size of an adult head for some thirty years for which she underwent x-ray treatment at the age of 50 with the result that the tumour almost completely disappeared Twelve years later however she developed metrorrhagia and the uterus became as large as the head of a full-term foetus Exploratory curetting showed the presence of sarcomatous tissue and on complete hysterectomy a sarcoma of the uterine mucosa of the size of an egg was found in the fibromatous uterus

314 Gonorrhoeal Bartolinitis

E ZOELTSCH-LASS (*Münch med Wschr* February 5 1937 p 210) found gonorrhoeal bartolinitis in 22.2 per cent of all cases of gonorrhoea in women Of the thirty-four cases observed twenty-two showed affection of one gland only, in the remaining twelve cases the disease was bilateral The patients were treated by one of the following methods (1) Electrocoagulation of the duct with a blunt platinum needle connected to the negative pole giving a current of 1 or 2 milliamperes for a few seconds this treatment may have to be repeated a number of times (2) Electrocoagulation combined with cauterization by 10 per cent silver nitrate in particularly stubborn cases (3) Injections into the gland of a 2 per cent solution of silver nitrate in unilateral and bilateral affections A cure was achieved in every case

315 Myoma and Pregnancy

According to E G ABRAHAM (*Zbl Gynäk.* February 13 1937 p 399) pregnancy in the "giant uterus" with multiple myomata is rare is not uncommonly first diagnosed after hysterectomy and is not a suitable condition for myomectomy A case is recorded of hysterectomy for myomata in a single woman aged 42 the womb reached the ribs and contained as well as seven myomata from the size of an apple to that of the fist, a foetus 12 cm long After operation the possibility of conception was denied but in view of the anatomical conditions exact diagnosis was impossible and the treatment must be regarded as correct P JANSON (*Zbl Gynäk.* February 20 1937 p 463)

describes the case of a primipara, aged 30 thought to have twins A child weighing 4 kilogrammes was born spontaneously after twelve hours labour Four hours later an attempt to turn for delivery of a second child showed the uterus empty save for an adherent placenta inserted between two large spherical myomata of the fundal region The infected puerperium was complicated by expulsion on the twentieth day of a necrotic myoma weighing 2 kilogrammes L GERIN-LAJOIE (*Union Méd Can* February 1937 p 160) also found difficulty in removing the placental remnants behind a submucous myoma. Four attempts had previously been made to get them out but little or no haemorrhage occurred recovery followed In a second case diagnosis lay between twin pregnancy and pregnancy with myoma only after spontaneous delivery was the so-called second head recognized as a myoma Bleeding was insignificant In both cases the largest myoma was the size of a grape-fruit

Pathology

316 Haematuria after Tonsillectomy

H RASMUSSEN (*Hospitalstudende* February 16 1937 p 191) has examined the urine of 117 persons whose tonsils or adenoids or both had just been removed There were only twenty-one children under the age of 16 whereas there were thirty-one men and sixty-five women in this series In 101 cases the anaesthesia induced was only local In the remaining sixteen cases ethyl chloride was used Only in four cases did the urine show some abnormality before the operation After it pathological changes were found in the urine in six cases These changes consisted in five cases of the appearance of erythrocytes in the urine a few days after the operation in one specimen casts and albumin were also found In none of these cases was there anything remarkable about the temperature after operation Discussing the cause of these post-operative changes in the urine the author suggests that an operation whether it be on an appendix or on a tonsil may set free toxins or small emboli which circulate in the blood stream and are deposited in the glomeruli, setting up a transitory focal glomerulo-nephritis or otherwise slightly injuring the kidneys so that erythrocytes escape through them It should be noted that in none of these six cases had the kidneys shown signs of disease before the operation Nor did any of the six patients with a history of nephritis some time before operation develop haematuria after it

317 Antigenic Types of *Cl tetani*

J B GUNNISON (*J Immunol.* 1937 32 63) has studied sixty-seven strains of *Cl tetani* of which fifty-six were toxigenic Previous work by various authors has shown that this organism can be divided into nine serological types on the basis of the H or flagellar antigens In the present paper attention is devoted mainly to the O or somatic antigens Working with washed cells that had been steamed for one hour and with rabbit antisera prepared from them the author found that all nine types contained a common O antigen and that a serum prepared against any one type would agglutinate organisms belonging to all the types Absorption experiments however showed that whereas Types I III VI VII and VIII possessed only one somatic antigen Types II IV, V and IX possessed an additional somatic antigen Some relation was observed between *Cl tetani* and *Cl tetanomorphum* O suspensions of the latter organism agglutinated to between quarter and full titre with antisera prepared against all types of *Cl tetani* but were unable to absorb the O antibodies from such sera This cross agglutination is of importance showing that great caution should be observed in the identification of tetanus-like organisms by O agglutination

GOLDEN MOMENTS

The Cup Final

Just on time he takes the ball in his stride and slams it into the net—the winning goal!

What a Golden Moment for him as he receives the coveted Cup!

But even he cannot buy a better tobacco than "Cut Golden Bar" at a shilling an ounce. But it must be Wills's

LET THE EYES CONFIRM YOUR DIAGNOSIS

Check your diagnosis by the evidence of the eye—by a routine examination of the fundus with the

EMESAY REFLEXLESS OPHTHALMOSCOPE

This is an instrument that entirely eliminates any corneal reflex. It ensures a perfect image even through a small pupil. A routine examination of the fundus with this ophthalmoscope serves as a valuable check upon your diagnosis and will frequently establish the existence of disease before other symptoms are apparent. Price **£4. 15. 0**

This price is for the Ophthalmoscope only without the Battery. Batteries are sold separately, price 1s. 6d., or a small earth free transformer is specially made for use with this and other small diagnostic instruments working from the main electric supply (A.C. only) price **£2 10**

MAW STEROTHERM

HOT AIR ELECTRIC AUTOMATIC STERILIZER

Patent No 427581

- EFFICIENT AND RAPID STERILIZATION
- SAVES TIME, SPACE AND MONEY

Maw Sterotherm Automatic Sterilizers have been installed in many Hospitals, Surgeries, etc., throughout the country and are functioning with the utmost efficiency. The special features of the Sterotherm ensure complete sterilization of Instruments, Dressings, Oils, etc. by the Hot Air method. It is the ideal unit where economy of space and outlay are essential.

May we send you details or arrange a demonstration?

SPECIAL FEATURES

- Automatic regulation of temperature
- No supervision necessary while in use
- Very small current consumption
- Articles in apparatus remain sterile until required as closure is bacteria proof
- Dressings quite dry after leaving Sterilizer
- Convenient size—length 16½ inches, diameter 9½ inches

PRICE **£20**

SALT AIR SURGICAL SERVICE

A WELL-DESIGNED SUPPORT
FOR THE LOWER ABDOMEN

SALT'S ENTEROPTOSIS BELT

● Specifically designed for lady patients who require support for the lower abdomen in particular, SALT'S ENTEROPTOSIS BELT is so constructed that fastenings are reduced to a minimum. Nevertheless, there are ample facilities for adjustment as and when required. Shaping at the sides holds the belt well down, without perineal straps. There are also Corset models for this condition detailed in SALT'S CORSET AND BELT BOOK—a publication which will be sent, post free per return, to any Medical Man who applies for it.

JOHN BELL & CROYDEN

Patent Triple-Drainage SUPRA PUBIC APPARATUS

The appliance consists of a kidney shaped celluloid cup containing three outlets so arranged that in matter in what position the patient may be reposing complete drainage may be effected Provision is made not only for drainage by catheter but also for the removal of any urine which may pass between the catheter and the abdominal wall

All three outlets are connected with a rubber bag fitted with a non return valve which obviates any back flow A special disc fitting retains the catheter in its desired position and this should be placed between the abdomen and celluloid cup

The advantages are that the urine is immediately passed into the rubber bag, all the parts can be removed and sterilized An easily detached adjustable belt is fitted

The pressure on the cup can be increased at the upper and lower border by increasing the tension on the upper or lower short webbing straps

Cleanse frequently and avoid any grease getting in contact with the rubber the celluloid must not be boiled

When ordering please state size of catheter and circumference of hips.

G.W.R. Travel Facilities for the Conveyance of Invalids

The Great Western Railway Company offer excellent facilities for the conveyance of hospital patients and other invalids

Patients can make a throughout journey on the Company's new type of stretcher, which very materially adds to the comfort of invalids who have to travel lying down

The Company also have well appointed invalid saloons fitted with special couches suspended between the roof and floor to prevent oscillation, bedding being provided where necessary. The invalid saloons also contain arm-chairs, settees, and table

Meals are obtainable in most cases, invalid chairs are available and every assistance is rendered by the Company's staff

Full details of the facilities may be obtained from the Superintendent of the Line G.W.R. Paddington Station or from any G.W.R. Station Master

Residential treatment of FUNCTIONAL NERVOUS DISORDERS

Including Alcoholism and other Addictions
(Certifiable cases are not received)

This beautiful part on a tested in the heart of the country (less than two hours from London by 1 M.S.R.) and surrounded by charming private grounds in which games and various recreational therapy are available is devoted to the treatment of Functional Nervous Disorders by psychotherapeutic and auxiliary methods.

Illustrated brochure and particulars obtainable from A. E. CAPTAIN, M.D., D.F.P.S., Resident Medical Superintendent.

A patient at THE CLINIC said this:

Here is a statement which is of equal interest to the Medical Profession and to the Public. It was made very recently by a patient at The Clinic to someone unconnected with The Clinic in any way whatever, and it was purely by chance that the statement became known to the Trustees of The Clinic. The name and address of the Patient are available to bona fide enquirers.

The Patient was a lady convalescing at The Clinic after an operation. She is keenly interested in medical progress. To one of her visitors she said: "There are eight floors, one of which is devoted entirely to maternity work, eight operating theatres which afford the surgeon every facility for the finest work, and a fully trained staff of some hundred nurses. The presence of two resident medical men in the building gives one the satisfying knowledge of being constantly, as it were, under the surgeon's eye. Another very important point which I think, should be considered by the heads of every nursing home is the care given to the feeding of the patients. Two special dietitians and six chefs provide a choice of menu for the convalescent which would rival a West End de luxe restaurant. THE CLINIC HAS AT LAST BROUGHT SOMETHING OF A SCIENCE INTO THE NURSING HOME. I HOPE ITS EXAMPLE WILL BE FOLLOWED ALL OVER THE COUNTRY."

Under its constitution the Company is bound to devote all surplus Revenue to the furtherance of its objects. Over £7,000 was so utilised in 1936. Enquiries and visits from the medical profession are welcome, and the Secretary will be glad to furnish further details.

The Council has not adopted a superannuation scheme.

PERCY SAUNDERS

Town Clerk

Town Hall Halifax

April 9th 1937

CITY OF SHEFFIELD

NETHER EDGE HOSPITAL.

Applications are invited from duly qualified medical women for the appointment of ASSISTANT MEDICAL OFFICER at the above hospital. The Medical Officer appointed will be required to assist in the general work of the hospital but her principal duties will be in the Maternity Section. She will also be required to assist at the Maternity and Child Welfare Clinics as directed.

Candidates should have previous hospital experience and post-graduate experience in Midwifery and Ante Natal work is essential.

The salary offered is £300 per annum plus £25 to £40 with the usual residential allowances.

The appointment will be subject to the provisions of the Local Government and Other Officers Superannuation Act 1928 and deductions will be made under this Act.

Applications stating age, qualifications and experience, accompanied by three recent testimonials should be sent as soon as possible to the Medical Superintendent, City General Hospital S.E. 2.

RUNCORN URBAN DISTRICT COUNCIL

TEMPORARY PART-TIME MEDICAL OFFICER OF HEALTH

MEDICAL SUPERINTENDENT OF INFECTIOUS DISEASES HOSPITAL.

Applications are invited for the above appointments from duly qualified and registered Medical Practitioners who are also registered in the Medical Register as holders of a Diploma in Sanitary Science, Public Health or State Medicine.

The salary as temporary part-time Medical Officer of Health will be £200 per annum and as Medical Superintendent of the Infectious Diseases Hospital £100 per annum. Total £300 per annum. The position will not be designated as an Established Post in accordance with the provisions of the Local Government and Other Officers Superannuation Act 1928.

The appointment will be subject to the provisions of the Sanitary Officer (Outside London) Regulations 1935.

In consequence of the approved scheme of the Cheshire County Council for the appointment of whole-time Medical Officers of Health under the provisions of Section 111 of the Local Government Act 1933 the appointment in the first instance will be for the period ending March 31st 1938 and thereafter renewable for such further period as may be necessary (subject to the approval of the Minister of Health) and pending the appointment of a whole-time Medical Officer of Health under the Scheme as mentioned above.

Conveying either directly or indirectly will be a disqualification.

Applications to be in the candidate's own hand, writing accompanied by two recent testimonials and endorsed "Appointment of Temporary Part-time Medical Officer of Health" must reach me on or before the first post April 23rd 1937.

JOHN HOWARD, Clerk to the Council.

Town Hall, Runcorn April 8th 1937

The ideal spring tonic

Livogen provides the ideal spring tonic for use in those varying conditions of lowered vitality which are so widespread at the end of the winter and in the early days of spring. These conditions, manifested in asthenia, lassitude, lethargy and debility, are often extremely difficult of exact diagnosis, but physicians everywhere report that the administration of Livogen is followed by a restoration of energy, increased appetite and a general return to normal conditions.

How We Assist in the Purchase of Medical Practices

Scotland's Oldest Insurance Company is prepared to assist Doctors in the buying of Medical Practices or Partnerships. The purchase price is repayable over a term of years, and a Life Assurance Policy is taken out as a collateral security. This scheme makes it unnecessary for a Doctor to approach his friends to act as guarantors and enables him to pay for his practice out of income. After the repayment of the loan, the Life Policy becomes a valuable asset to the Doctor.

Many Doctors have already established themselves in practice with the aid of the "Caledonian" Scheme. The Interest Rates are particularly moderate. The Accountants' charges for investigating the practice and the Legal Fees for preparation of the deeds and documents in connection with the Loan are paid by the Company in completed cases. Arrangements can be made to meet special cases.

WHEN TEMPERAMENTS CLASH

A Study of the Components of Human Temperament

By Murdo Mackenzie, M.D., M.R.C.P.

Physician for Psycho-logical Medicine St. John's Hospital Lewisham and The Wilton Hotel Albemarle

This is a human v. a. d. and whether or no we perform to capacity depends on our relations with other humans and on little else. In all walks of life from the battle of the Stock Exchange to the heated contention of the study the effect of human contact on the nervous system is becoming the serious modern problem.

There is a good reason for the wide recommendation of "du Maurier" cigarettes by the medical profession. The filter tip ensures no bits in the mouth. Three layers of pure white vegetable tissue interleaved by two layers of cellulose fibre keep every hint of irritation from a sensitive throat. And "du Maurier" are made with both plain and cork tips.

du MAURIER

the perfect cigarette with the exclusive filter tip

By J W BIGGER, MD, FRCPI

An entirely new shorter textbook for the student and the practitioner by the Professor of Bacteriology and Preventive Medicine at the University of Dublin. It has been the aim of the author to provide reliable information of value both to the student and to doctors in general practice and the requirement of the qualified man have been as fully covered as those of the examination candidate. Among the chapters calling for special note are those on Poison Gases including gases used in warfare and on the Assessment of Normal Health. Pp xii+406 with 18 illustrations. Price 12s 6d Postage 6d Abroad 1s

Emanotherapy

By F H HUMPHRIS and LEONARD WILLIAMS

The first book to be published in this country dealing with the treatment of disease by the use of radium emanation. The technique and the scope of the treatment are fully dealt with and the book forms an interesting introduction to a method of treatment much studied on the Continent but little known over here. Pp x+188 with 6 illustrations. Price 7s 6d Postage 6d Abroad 1s

Bovine Tuberculosis in Man

By NATHAN RAW, CMG, MD

A short account of a very vital problem—the control of Tuberculosis as transmitted from animals to man. Of great interest both to the general practitioner and the Public Health Officer the book is based on the author's personal experience comprising the treatment of over 9,200 cases of Tuberculosis together with laboratory research work. Pp viii+128 with 12 plates. Price 6s Postage 4d Abroad 8d

The Physiological Basis of Medical Practice

A most complete and up-to-date presentation of the practical clinical applications of the latest knowledge of physiology. This book clearly points out the physiological principles underlying various disease states and shows how a knowledge of such principles aids in the interpretation of symptoms or in the directing of treatment. By C H BEST MD D.Sc. FRC.P., and N B TAYLOR MD F.R.C.S. F.R.C.P. Pp xxii+1684 with 399 illustrations. Price 45s Postage 9d Abroad 2s

Mental Deficiency

By A F TREDGOLD, MD, FRCP

The new sixth edition of this classic Encyclopaedia of Mental Deficiency has undergone a most thorough revision. Many chapters have been extensively rewritten, while considerable additions have been made to others. A section has also been added on the chronological development of the normal mind. Many new plates are included. Pp xvi+556 with 14 tables and 34 plates. Price 25s Postage 6d Abroad 1s 3d

For OBESITY, PTOSIS, FAULTY POSTURE and POST-OPERATION WEAR

Medical men supervised the Design of the Linia Belt

While the Linia Belt was being evolved it was frequently submitted to tests by medical men until with their advice it became the recognised belt for men's wear. It is of course made to measure for every case.

The Linia Belt is prescribed for obesity because while replacing the ptotic organs it exerts a gentle continuous massaging action helping to disperse adipose tissue and to tone and brace the muscles. Its uplifting action its adjustability make it also the belt for various ptotic conditions for post-operation wear for wear by the older man for golf riding and other sports.

The front is of thin fine non-elastic tricot the back is of strong elastic fully adjustable by means of slide buckles. The whole belt is designed to support with an uplifting action.

Linia Shorts for the Younger Man

Designed to give stimulating beneficial support and massage only where needed Linia Shorts are the ideal abdominal wear for the younger man who wishes to guard against the ill-effects of sedentary life. For everyday wear they are practical comfortable, convenient.

For the sportsman they allow of free movement, whilst minimising the risk of hernia. Linia Shorts are easily washable, porous and hygienic.

Note firm elastic tension round the abdominal region and the light tension round waist and legs which admits of free circulation.

You are invited to examine the Linia Belt and Linia Shorts

We shall be pleased to forward a specimen Linia Belt or Linia Shorts for your inspection free of charge.

POST ORDERS can be carried out to your direction on receipt of maximum measurement round girth and required depth from pubis upwards (usual depths 9, 10 and 11 inches).

PRICES Linia Belts from 2 Gns to 7 Gns
Linia Shorts from 25/- to 4 Gns

A reduction of 2/- in the £ is made on purchases for personal use to members of the Medical Profession.

The Linia Belt and Linia Shorts
are on Sale Only at J. ROUSSEL, Ltd (Dept ME),

For debility—

The above illustrations show (1) a case of peritoneal tuberculosis with extreme debility (2) the same child after a course of ultra-violet irradiation.

(Courtesy of Biggart Hospital Home)

Tonic irradiation with the Alpine Sun Lamp

Hanovia actinotherapy equipment can be inspected in showrooms of electric-medical dealers throughout the Empire at British Industries House London also at

HANOVIA SHOWROOMS:
2, VICTORIA STREET LONDON S.W. 1
(Phone Whitehall 3627)

Every patient who shows signs of debility, lowered resistance, or poor recuperative powers, indicates tonic irradiation with actinic rays. These conditions form "probably the most responsive of all general ailments to ultra-violet rays." Under sunlamp treatment on the right lines, instability of metabolism, deficiencies in weight, nervous disorders, lowered muscle tone are corrected. After a course of actinotherapy, such cases "usually go on improving without further treatment."

With the Hanovia Duo-Therapy Unit you are equipped to administer ultra-violet and other forms of actinotherapy in your own consulting room. The one unit, easily operated from any domestic electric supply, furnishes equipment for many forms of light treatment. Specialists and practitioners throughout the world use this famous Hanovia lamp.

—the ALPINE SUN Lamp

When you apply actinotherapy your results depend on your equipment. It must be powerful, accurate and dependable. That is why three-quarters of the actinotherapy lamps in use to-day were made by Hanovia.

The Coupon is for your convenience

MODERN AIDS TO HEARING

These announcements are intended to illustrate the latest advances in acoustic science in order that the medical profession may be kept informed of the newest aids available for the deaf

"Electro-Ear"

Bone conduction micro-telephone wearable aid sometimes suitable for cases of catarrhal - deafness, otosclerosis and ankylosis. The instrument comprises the transmitter, amplifier on battery, and bone conduction oscillator, held to the head by a light headband. These aids are easily worn inconspicuously and are very effective for conversation, particularly at reasonably short distances.

A copy of our new booklet describing all types of aids will gladly be sent on request

SALTAIR SURGICAL SERVICE

During Eight Reigns

Founded in the year 1793 in the reign of George III the House of SALT has a history extending over a period of a hundred and forty-four years—during eight reigns. This fact is in itself very definite evidence of the Quality of the Products and the Efficiency of the Service.

Holders of Three Royal Appointments

These were granted to SALTS by T.M. Queen Victoria, King Edward VII and King George V—yet another manifestation of the prestige enjoyed by SALTAIR SURGICAL SERVICE. In close but never intrusive co-operation with the medical profession SALTS have been responsible for many improvements in the design of *individually produced* Surgical Appliances. But the same unceasing experiment still goes on, and every working day of the year SALTS experts are constantly endeavouring to effect still further advances for the amelioration of human suffering. The confidence of medical men has been won and maintained by rigidly honest principles and respectful collaboration. The Guarantee which appears at the head of every announcement issued by this House is a symbol of SALTS absolute sincerity. Incidentally, all of SALTS advertising is strictly confined to the Medical Press, and no direct appeal is made to the public.

With such a high reputation achieved in the past SALTS confidently face the future.

Showing exactly how it differs from other types of flour in several important respects

CONSTITUENTS	WHITE FLOUR	WHOLEMEAL FLOUR	HOVIS FLOUR
STARCH	72.7	67.6	65.9
FAT	1.5	2.1	3.3
CELLULOSE	0.3	2.5	0.7
PROTEIN	11.0	12.4	15.7
SALTS	0.5	1.6	1.7
WATER	14.0	13.8	12.7
VITAMIN B CONTENT	Very Poor	Rich	Very Rich

★ Scientific research brings to light certain facts of the highest importance to medical men relative to the food value of HOVIS as compared with other brands. Analysis shows that HOVIS flour by reason of the added 25 wheat-germ in its composition possesses a much higher content of Vitamin B. Moreover it is richer in protein and fat—the builders of vitality, bone and muscle—and the absence of cellulose renders it more easily digestible. These facts point to one conclusion that in dietary value HOVIS holds undoubted supremacy for promoting health and vigour.

“LIVEROID”

BRAND

PREPARATION OF LIVER

“LIVEROID” is a concentrated preparation of the uncoagulated juice of liver, in combination with other blood and nerve forming substances Usefully prescribed for —

Pernicious anæmia and all forms of megalocytic anæmia characterised by high colour Index
Normocytic or secondary anæmias due to loss of blood from any cause.
Microcytic anæmias in which iron therapy combined with liver is desirable.
General debility, neurasthenia or weakness

“LIVEROID” is pleasant to take, and can be given in the form of an appetising beverage

Modern Iron Therapy

Iron 'Jelloids' are an elegant and reliable means of administering the proto-carbonate of iron. The preparation has none of the disadvantages of Pil Bland. The iron content remains fresh and unoxidized indefinitely, and injury to the teeth is avoided.

The 'Jelloids' are highly effective in the treatment of achlorhydric anæmia and indeed in all the simple anæmias in which massive iron therapy is indicated.

Iron Jelloids

You are cordially invited to apply for samples for clinical test.

The Iron 'Jelloid' Co Ltd, King George's Avenue, Watford, Herts

OVALTINE

FOR THE OLD AND FEEBLE

DURING old age when the digestive powers and vitality are on the wane the problem of satisfactory feeding often becomes acute. A solution to this difficulty is found in Ovaltine. Its delightful flavour appeals to the jaded palate; its digestive action aids the enfeebled assimilation while its high nutritive value stimulates the flagging metabolism. It is a boon to the aged.

In Ovaltine the nutritive constituents of fresh milk, eggs and malt are transformed into crisp granules which dissolve readily in milk to form a delicious beverage. A cup of

Ovaltine in the morning ensures energy for the day and a cup on retiring generally relieves the sleeplessness so common a symptom of old age and gives digestive rest.

Ovaltine enriches the diet in certain important factors notably calcium and vitamins A and B₂ which recent investigations have shown to promote longevity.

Proved efficiency with pleasantness

In spite of its high germicidal efficiency (Rideal-Walker 30) 'Dettol' can be used at strengths impracticable with carbolic and cresylic antiseptics. It is non-poisonous, non-staining, pleasant smelling. It has been shown that when 30% 'Dettol' is rubbed into the hands and allowed to dry the skin remains insusceptible to infection by haemolytic streptococci for at least two hours, unless grossly contaminated. 'Dettol' is also stable in the presence of blood, pus, faeces and other organic matter.

Obtainable from chemists in 1/- and 3/- bottles, and in larger sizes for medical and hospital use. These prices do not apply in the Irish Free State and Overseas. Samples and full information on request.

"CERABAN" ADHESIVE SELF-SUPPORTING BANDAGE

The Supplementary or Alternative Treatment to Self-Adhesive Elastic Bandages for
SPRAINS, DISLOCATIONS, CONTUSIONS, SWELLINGS, VARICOSE VEINS, VARICOSE ULCERS, etc

Its use eliminates the risk of Dermatitis which so frequently arises from the application of Self adhesive Bandages

"CERABAN" whilst free from rubber, possesses elastic properties and when carefully applied to the limb gives substantial support. It is porous, adhesive, and non-irritating, will not chafe and permits of complete respiration of the skin.

In the treatment of Varicose Ulcers the use of "Ceraban" Bandage eliminates the risk of Dermatitis which occasionally occurs through the application of self adhesive Elastic Bandages. In the less severe of such cases a distinguished authority writing in the *Lancet* page 580, Sept 7th, 1935, issue recommends the use of "Ceraban" Bandage cut in strips as a first and protective dressing prior to covering with self adhesive Elastic Bandage and in the more serious cases the complete replacement by "Ceraban". It is waterproof, antiseptic, and being spread on an extensible material readily conforms to the shape of the limb and therefore will not slip.

ACETYLCHOLINE B.D.H.

In Intestinal Irregularities

The presence of acetylcholine, or some closely-related substance, in the walls of the intestines is essential for the maintenance of intestinal peristalsis, the administration of acetylcholine overcomes quickly the paralysis of the intestines caused by the diminution of the amount of this substance present in the tissues. To obtain maximum therapeutic

effects it is essential that the product employed in this substitution therapy should be constant in composition and uniform in effect, these desiderata are fulfilled in Acetylcholine B.D.H.

Acetylcholine B.D.H. is issued for intramuscular injection in a stable solution of its bromide.

MANDELIX

(Elixir of Ammonium Mandelate B D II)

In Urinary Tract Infections

In the treatment of urinary tract infections the routine method is to administer Mandelix, a concentrated flavoured elixir of ammonium mandelate in a palatable form, two fluid drachms of this elixir contain the equivalent of the full therapeutic dose of pure mandelic acid.

It is found in the majority of cases,

even in those having a chronic infection, that a sterile urine is produced usually within a week.

Mandelix is supplied in bottles containing $7\frac{1}{2}$ fluid ounces—sufficient for treatment lasting 7 days—and it is obtainable from the principal pharmacists.

Protect Mother and Infant with Argyrol

The best opinion of today is that antenatal treatment of all gravidæ should include a thorough search for gonorrhoea, irrespective of social status.

Where there is the slightest suspicion of gonorrhoea in one parent or both protection is afforded by the use of vaginal tampons saturated in 25 per cent solution of Argyrol.

Brand Silver Vitellin—the standard in gonorrhoea

Argyrol has peculiarly sedative, inflammation allaying qualities, and its clinical successes of 30 years' duration may be easily accounted for by pertinent chemical facts.

The very great differences between

Sole Distributors:

FASSETT & JOHNSON, LTD.,
86, Clerkenwell Road, London, E.C.1.

Argyrol and other silver salts in silver ion and in hydrogen ion concentration (or alkalinity) no doubt have much to do with the irritation noted by doctors when allegedly equivalent mild silver proteins are substituted. The pH and pAg of Argyrol Brand Silver Vitellin are especially regulated for treatment of delicate mucous membranes.

T.G.S.

Toxic Goitre

In many so-called surgical conditions, surgical interference may be considered unjustifiable. In such patients prolonged medical treatment is often necessary, and the maintenance of a suitable diet may cause the physician much concern. Sanatogen, a chemical combination of ninety-five per cent concentrated milk casein and five per cent sodium glycerophosphate, is easily digested and absorbed, and, moreover, stimulates a fuller utilisation of whatever ordinary food can be taken.

"I think Sanatogen might be used more often and with great advantage in cases of Toxic Goitre where operation is unjustified. I have used it in one such case and it was the only preparation after long trial which prevented her from losing weight, in fact enabled her to gain weight, and which seemed extremely beneficial to her highly nervous and excitable state"—M B, B S

Initial Daily Dose
Two Tablets

Laxatives, it is well known nowadays, must have two essential characteristics

- 1 They must be biological, i.e., they must accord with and imitate in their action the natural physiological processes of the intestine
- 2 They must be capable of educating the intestine so that the habit of a laxative is not formed and the intestine can function unaided when bowel adjustment is attained

Taxol has both these advantages

Taxol has not the violent irritant action of many laxatives and purgatives but stimulates the intestine by processes which resemble those of nature. The intestinal gland which is an important part of its composition acts on the intestine by reinforcing the deficient function which has culminated in constipation. This stimulating action is gentle and does not force the weakened intestine to efforts beyond its power which would culminate in aggravation of the constipation.

Taxol is not habit-forming. It re-educates the intestine to resumption of normal function unaided thanks to the biological nature of its action. It contains no irritant drug of violent and artificial action to which the intestine can become accustomed. On the contrary many stubborn cases of constipation, after a course of *TAXOL*, revert to normal and regular peristalsis.

Acne Vaccines

It has been claimed that, in certain cases of acne, where the ordinary staphylococcic vaccines have failed to ameliorate the condition good results are obtained by the use of a mixed vaccine of the *Bacillus acnes* (Sabouraudi) and the *Staphylococcus aureus*. In addition to the mixed vaccine—one consisting of the *Bacillus acnes* (10 millions per cc) alone is prepared

DOSSAGE When the mixed vaccine was first tested, it usually 125 million caphyocin and 125 million bacilli. The dosage was raised to 250 and 500 million caphyocin and bacilli respectively in the 1967 model.

Two valuable foods compared

The figures are for quantities of 1 oz. each of Milk and Bemax

That the Vitamin B₁ content of Bemax is 60 times that of milk is probably not surprising, but the fact that its calorific value is 5 times greater than milk, and its protein and carbohydrate content ten times as high (to quote only three examples from the above charts), emphasises the high all-round nutritional and therapeutic value of this natural Vitamin tonic food. Special importance probably attaches to the high IRON content of Bemax.

Laboratory reports on Bemax and a clinical sample for personal trial are on request

The Bemax Laboratories (Dept B 35), 23 Upper Mall, London, W 6

Obliteration-therapy by means of Clauden

This is a new and very successful treatment, by injection, of ganglions, hygroma, bursitis, etc., eminently suitable for use in general practice

Clauden—the rapid and really effective physiological haemostyptic agent for internal, external, gynaecological, oto-rhinological and other forms of bleeding such as are incidental to minor surgery

INTERNAL HAEMORRHAGE

for the lungs, stomach, intestine, bladder, kidneys etc.,

GYNAECOLOGICAL HAEMORRHAGE

menorrhagia and metrorrhagia post partum haemorrhage haemorrhage after miscarriage myomic bleeding climacteric haemorrhage, haemorrhage in operative gynaecology,

EXTERNAL HAEMORRHAGE

also haemorrhage occurring in minor surgery and oto rhinology

is arrested with rapidity and certainty without the risk of after bleeding

Bleeding with its multiform dangerous consequences frequently provides the physician with one of his most difficult therapeutic problems. At such anxious times it is of the utmost importance to have ready at hand a reliable styptic agent

'BENZEDRINE'

BRAND

TABLETS

Each tablet contains 10 mg
(0.1543 gr) β Phenylisopropylamine
Sulphate (Isomyn Sulphate)

In Persistent Exhaustion

An article by Nathanson in the *Journal of the American Medical Association* (108 528, Feb 13, 1937) shows that 'Benzedrine' Brand Tablets appear to exert a beneficially stimulating action on the higher centres of the central nervous system, with lessening of fatigue and increased energy. They also act favourably in states of persistent exhaustion and depression.

A clinical supply of 'Benzedrine' Brand Tablets together with the literature will gladly be sent to any interested physician.

The Safe Anti-Arthritic

CALSIOD

BRAND

TABLETS

CALSIOD (calcium ortho-odoxybenzoate) provides the practitioner with a safe agent for the relief of pain, swelling and muscle spasm in arthritis and rheumatoid conditions generally. It also has a wide field of usefulness as a palliative in the many ill-defined conditions loosely grouped under such term as lumbago, rheumatism, neuritis, fibrositis, etc.

A Palatable and Efficient Tonic

NEURO PHOSPHATES

(ESKAY BRAND)

Neuro Phosphates (Eskay Brand) presents the acid glycerophosphates in a stable and readily assimilable form while its marked palatability is of the highest importance in encouraging the co-operation of the patient. It is an ideal tonic in convalescence in old and young alike restoring nervous energy in many chronic conditions including nerve weakness in the aged, neurasthenia, etc.

When the Kidneys must not
be irritated . . .

BRAND'S Essence is absorbed and assimilated without producing any protein by-products which must be disposed of by the kidneys. It is a desirable stimulant even when the kidneys are organically weak or over-exercised through fever or conditions of similar effect. In no digestive circumstance is the protein content of Brand's precipitated in solid form, and its protein-sparing proportions are considerable.

BRAND'S CHICKEN
OR BEEF **ESSENCE**

is never contra-indicated

BRAND & CO. LTD., SOUTH LAMBETH ROAD - LONDON S.W.3

WEANING TIME

From the age of six months, Robinson's 'Patent' Groats and milk is an ideal weaning diet. It is easily assimilated and the slightly laxative properties of the Groats counteract any constipating effects of the milk. Moreover, Groats has the highest fat content of all cereals and is rich in protein. Carbohydrate is supplied in 'Patent' Groats in a form which helps to prevent diarrhoea and vomiting. Baby's digestion is gradually prepared for more solid foods, and bone and muscle are developed at a critical growing stage.

ROBINSON'S "PATENT" GROATS

NEMBUTAL PRODUCES DESIRED RESULTS WITH ONE-HALF THE DOSAGE OF MOST OTHER BARBITURATES

Administered orally, rectally or, in emergencies, intravenously, Nembutal exerts an extremely rapid but brief hypnotic and a pronounced sedative action from a dosage only about one-half that required with most other powerful barbiturates. This small dosage reduces the recovery period also by about one-half and, by lessening the amount of the drug to be eliminated, makes Nembutal, clinically, one of the safest of the barbiturates.

- Safety, rapidity and brevity of action

recommend Nembutal for use not only as a pre anaesthetic sedative in major and minor surgery, but also in the treatment of insomnia, hysteria, sea sickness, nausea from any cause, eclampsia, delirium tremens, convulsions from strychnine or other poisoning and in obstetrics—with or without morphine and scopolamine. Nembutal has also been used with much success as a supplement to morphine in controlling the pain of early cancer. • Nembutal is available through pharmacies in a

wide variety of forms, the most widely employed of which are the $\frac{1}{2}$ grain and $1\frac{1}{2}$ -grain capsules for oral use. The drug is also supplied in the form of 2 grain suppositories. Comprehensive literature and a free trial sample of Nembutal $1\frac{1}{2}$ -grain Capsules will be sent upon request. The coupon below is for your convenience.

"CALCYDIC"

calcium vitamin D granules

In Tins of $\frac{1}{2}$ lb 2/3, and 1 lb 4/-

Descriptive literature and clinical trial sample will be sent on request

Supplies of calcium and phosphorus are essential to the action of vitamin D. Whereas ordinary calcium phosphate contains 1 part by weight of phosphorus to 2 of calcium, dicalcium phosphate (CaHPO_4) contains 3 parts of phosphorus to 4 of calcium. "Calcydic" Granules are delicious. Each teaspoonful contains—

Dicalcium phosphate - $7\frac{1}{2}$ grains
Vitamin D - 1 500 units
Glucose, Chocolate and Cane Sugar

These granules may be given to children or adults, prophylactically or therapeutically, in rickets, pregnancy, lactation, osteomalacia, menorrhagia, convalescence, chilblains, and urticaria.

Manufactured in England by

ALLEN & HANBURY LTD, LONDON, E 2

The success of Cow & Gate Milk Food as an artificial milk diet for infants who cannot be fed naturally is due to the detailed care which underlies every stage of its preparation.

Cow & Gate has been proved to be specially rich in natural vitamins and mineral salts.

The composition of the food is constant and standardised.

The special method of the preparation results in bacteriological sterility without affecting the natural vitamins.

The digestibility of Cow & Gate is equivalent to that of normal breast milk.

Cow & Gate Half Cream Milk Food is specially indicated for young and delicate babies and for cases of fat intolerance in infancy.

Clinical samples and literature will gladly be sent on to any member of the Medical and Nursing Professions.

HAEMATEMESIS AND MELAENA*

BY

L. J. WITTS, M.D., F.R.C.P.

Professor of Medicine University of London and Physician in Charge of the Medical Unit St Bartholomew's Hospital

During the last few years there has been much controversy over the treatment of bleeding from the stomach and duodenum. Should we operate and if so what operation should we do? Should we transfuse? Is morphine harmful? Should we feed or starve the patient? Should we give alkalis? Does any treatment at all favourably influence the mortality? What is the mortality? On none of these points is there general agreement, and the mass statistics which have been quoted have done little to clarify the issue.

One is reminded of those barbarian hosts numerous but inchoate which again and again throughout history have been routed by the discipline of a few. Though small in number the results of a single physician, surgeon, or team who is actively interested in the disease and gives the patients individual attention and supervision are more valuable than a large assortment of cases collected from different wards or indeed different hospitals and treated with very variable degrees of thoroughness.

No well informed person would try to assess the prognosis and treatment of diabetes mellitus or pernicious anaemia from mass hospital statistics. He knows that they inadequately reflect the benefits conferred by insulin and liver extract. For accurate information about these diseases he goes to the records of individual physicians such as Joslin or Wilkinson, so that he can be sure that the patients have received the appropriate treatment for their disease. In the same way when discussing haematemesis and melaena we should quote the best individual results of treatment such as those of Finster (1936) and Meulengracht (1936) though we must at the same time decide whether these results are capable of general attainment. There is still need then for data about the prognosis of gastro-duodenal haemorrhage which bear the stamp of individual interest and treatment.

A Fatal Case

My own observations are based on a series of twenty-seven cases which includes every patient with the presenting symptom of haematemesis, melaena or consequent acute anaemia whatever the cause of the gastro-duodenal bleeding who has been admitted to the Medical Unit at St Bartholomew's Hospital in the two years during which I have been in charge. For the intensive investigation of these patients I am indebted to my colleague Dr F. Avery Jones. I shall have many occasions to refer to the analysis by Culpin and Price (1922) of the 105 cases of severe haemorrhage from peptic ulcer which were admitted to the medical wards of St Bartholomew's Hospital between the years 1925 and 1929, an important paper which has not received the attention

* A British Medical Association Lecture given at Exeter on February 17.

it deserves. I have been interested in gastro intestinal diseases for a number of years but my attention was focused on the problem of alimentary bleeding by the death of one of the first patients with haematemesis whom I treated in my new wards.

A railway porter who had been treated for syphilis of the liver in 1923 at the age of 44 came under treatment for a chronic duodenal ulcer in 1933, when he was 54. He remained at work with occasional spells off duty because of pain until January 22 1935 when he had three melaena stools felt faint and went to bed. On January 23 1935 he vomited a pint of blood and had another melaena stool. He was admitted to my ward on this day. He was well preserved for his age which was now 56 but was cold and sweating. Only sips of water were given in the first twenty-four hours the intention being to follow the Lenhartz ladder diet.

On January 26 he had melaena again his pulse rose from 80 to 130 and he was given a transfusion of 300 c.cm. of blood and a saline drip per rectum. He returned to the bottom rung of the Lenhartz ladder but on February 7 after an enema his haemoglobin count fell sharply from 50 to 38 per cent and a transfusion of 400 c.cm. of blood was given. He remained on the eighth rung of the Lenhartz diet and on February 11 since his stools were still dark and sticky and his haemoglobin only 44 per cent a third transfusion of 400 c.cm. was given. He kept well and his pulse stayed about 70 till February 18 when he again had haematemesis and melaena. Two litres of blood were transfused during the next thirty hours. On February 20 he had melaena once more and his blood pressure fell to 70/30. He received 600 c.cm. of blood on February 21 and on February 22 laparotomy was performed a further 800 c.cm. of blood being given at the same time. An ulcer was found in the second part of the duodenum which penetrated deep into the pancreas and which could not have been removed without great difficulty. The duodenum was divided through its first portion and a partial gastrectomy was performed. A blood transfusion of 500 c.cm. was given on February 23 but the patient died from pneumonia on February 24.

Necropsy showed that there was a large diverticulum just below the junction of the first and second parts of the duodenum on the medial wall. The mouth was about 1½ inches in diameter the diverticulum passed into the head of the pancreas. Nearly the whole of the interior of the diverticulum was ulcerated but no large vessel had been eroded. The stump of the duodenum showed no evidence of covering of the sutures and all the tissues in this region and around the head of the pancreas were sodden and oedematous. The stomach was grossly distended with offensive dark faeculent fluid and the whole caecum and the proximal loop of the anastomosis were similarly distended. The distal loop and the jejunum for about two feet below were collapsed but the whole of the gut below was greatly distended. The obstruction at the site of the anastomosis appeared to be due to the distended colon lying forwards the stomach and the region of the anastomosis.

This tragedy caused me a good deal of heart searching. The duodenal lesion was of such a nature as to demand

an extensive operation which a patient in a weak state could not be expected to stand. The patient received large amounts of blood before and during his operation, and I did not think the failure could be attributed to inadequate transfusion. We have learnt to associate failure of reaction at the peritoneal suture line and post-operative distension of the stomach and bowel with inanition and avitaminosis (Archer and Graham, 1936). I felt dissatisfied with the orthodox treatment of alimentary haemorrhage by starvation, with operation on patients who seemed unlikely to benefit from medical treatment. Had I known the task I was setting the surgeon I should not have asked him to operate, and my first question was to decide in what circumstances I should advise operation in the future.

Difficulty of Diagnosis of Source of Bleeding

The *Lancet* in an annotation on December 12, 1936, stated that in view of the improved results obtained by the combination of operation with massive transfusion it had become more urgent than ever for the physician to learn to recognize the patients who, if they are medically treated, are likely to die. Denys Jennings (1936) suggests that there are two types of gastro-duodenal haemorrhage: erosive haemorrhagic gastritis, in which the mortality is negligible, and chronic ulcer, in which

the mortality is high. Much as I should like to examine by gastroscopy patients who are bleeding from the stomach and duodenum, I do not think it would be good medicine, and I know no other way in which the differential diagnosis between erosion and chronic ulcer can be made.

The previous history is of little value. Schindler (1937) the pioneer of gastroscopy, writes:

"The average duration of symptoms in our cases of gastritis was five and one-half years. The distress was usually epigastric in the superficial and hypertrophic form it was usually delayed. Periodicity seems to be present in some cases of hypertrophic gastritis. Alkali gave relief in about half the cases. Gross sometimes fatal haemorrhages from gastritis have occurred."

Seven of my twenty-seven patients had a long history of dyspepsia suggestive of chronic ulcer, but when they were radiographed, as soon as possible after bleeding, no ulcer was seen, in two of them healing acute ulcers were seen through the gastroscope. Nor can acute and chronic ulcers be distinguished by the amount of blood lost for the haemorrhage from acute ulcers may be severe, repeated, and fatal. It is impossible by clinical methods to decide whether the patient is bleeding from an acute or chronic ulcer.

In Table I I have noted the duration of dyspepsia before the haematemesis, the provisional diagnosis made

TABLE I—*Consecutive Series of Twenty-seven Cases of Haematemesis and Melaena*

when the patient entered hospital and the final diagnosis, which was based on radiography and test meals in all cases, with the addition of gastroscopy and laevulose tolerance tests of hepatic efficiency when no ulcer was demonstrated by the x rays. All the cases with negative x ray reports were not gastroscopied, and I have not attempted to distinguish accurately between gastritis, duodenitis, and acute ulcer.

Of the twenty seven cases eight were chronic peptic ulcers, two were gastro jejunal ulcers, fourteen were gastritis, duodenitis, or acute ulcer and three were cirrhosis. I have already referred to the fact that seven of the cases of gastro duodenitis gave long histories suggestive of chronic ulcer. The severity of the cases was assessed at approximately 30 per cent mild, 40 per cent moderate, and 30 per cent severe. There was no difference in severity between the chronic ulcers and the cases of gastro-duodenitis and acute ulcer. It is noteworthy that ten of the patients had recurrences of bleeding after admission to hospital, four of them were severe and repeated, but only the patient submitted to operation died. I am also surprised to find the percentage of chronic peptic and gastro-jejunal ulceration so low, only 37 per cent, because it is generally assumed that it is a much commoner cause of gastro duodenal bleeding in this country than acute ulcer or gastritis. The following cases show how hard it is to diagnose correctly the nature and situation of the lesion responsible for a gastro duodenal haemorrhage.

CASE 1

A man aged 56 had had a weak stomach since acute appendicitis at the age of 26. For nine months he had had remittent dyspepsia characterized by dull aching pain situated in the epigastrium coming on one to two hours after meals and relieved by alkalis. His attack of melaena was preceded by a sudden severe epigastric pain half an hour after breakfast. The provisional diagnosis was chronic gastric ulcer. An x ray examination four weeks later showed no ulcer. Through the gastroscope a healing ulcer a few millimetres in diameter was seen and the mucous membrane showed chronic gastritis. It was concluded that the ulcer with its attendant haemorrhage was an episode in the course of a persistent gastritis. Dyspepsia of the same type was still present a year later.

CASE 7

A man aged 64 had had attacks of indigestion for a number of years lasting for a few weeks and not returning for some months. They hardly amounted to pain, an empty feeling in the epigastrium being relieved by food. He had nevertheless consulted his doctor and taken diet and medicine. An attack of this kind had been in progress for three weeks before the haematemesis and melaena which brought him into hospital and a chronic duodenal ulcer was suspected. An x ray examination eleven days later while the stools still contained occult blood revealed a high stomach but no ulcer in the stomach or duodenum. Gastroscopy three weeks after the haemorrhage showed a normal gastric mucosa. He had hyperchlorhydria and a normal laevulose tolerance. A year later he was very well. I cannot believe that it would have helped these two patients in particular or my statistics in general to have submitted them to operation in the first forty-eight hours.

CASE 14

This patient who had bled from a duodenal ulcer at the age of 42 bled from a gastric ulcer at 44. There was no change in symptoms to indicate the changed location of ulceration.

Operative Mortality

Acute ulcers are so difficult to find that one presumes that the surgeon would perform a gastrectomy if he could not easily palpate an ulcer. If he discovers a chronic

ulcer he must likewise perform an extensive operation of the nature of a partial gastrectomy or a gastro duodenectomy, since lesser procedures such as gastro-enterostomy and ligation of arteries have proved of no value. The mortality of gastrectomy depends on the type of case submitted to operation and at St Bartholomew's Hospital where the surgery of peptic ulcer has been wisely conservative gastrectomy has been performed for severe and intractable lesions only, the primary mortality of partial gastrectomy for peptic ulcer in the years 1919 to 1935 was 16.9 per cent (Payne 1936). I have given reasons elsewhere (Witts, 1936) for my belief that this figure could be reduced by better and longer pre-operative preparation but I am certain that it would be raised if it became our practice to recommend operation on all patients believed to be bleeding from a chronic ulcer.

Cullinan and Price (1932) showed that a solitary haemorrhage was rarely fatal (mortality 4 per cent) but that the mortality rose sharply with recurrence (40 per cent) and reached 60 per cent in patients with more than one recurrence. The prevention and treatment of recurrence is therefore the key to the reduction of the mortality from gastro-duodenal haemorrhage. I do not believe that it is possible to prevent deaths by immediate operation on all cases of gastro duodenal haemorrhage, or on all severe cases or on all cases believed to be bleeding from a chronic ulcer and I think any of these practices would lead to an appalling rise in the general mortality from haematemesis and melaena. Finally I do not myself believe that it is wise to treat recurrent bleeding by operation though I realize that the available data are hardly sufficient for reliable judgement on this.

Cullinan and Price collected statistics of twenty five patients with haematemesis submitted to operation of whom eighteen died, this is a mortality of 72 per cent—higher than the mortality of recurrent bleeding treated medically—though not all these twenty-five had bled more than once. All the patients in our two series submitted to operation for gastro-duodenal haemorrhage at St Bartholomew's Hospital appear to have died. Finsterer (1926) records a mortality of only 5 per cent for immediate operation and 30 per cent for late operation for bleeding peptic ulcer but Finsterer is an exceptional man and we may no more expect as low a mortality at the hands of the average surgeon than we may expect to find Kreislers in every local orchestra. Moreover Finsterer's results are much inferior to those of Meulengracht (1936). Meulengracht has a mortality of only 1 per cent for medical treatment, and while every surgeon cannot be a Finsterer every physician can duplicate Meulengracht's simple treatment. Massive continuous drip blood transfusions should not be an incentive to surgery, as they are just as likely to improve medical results as surgical results.

I am indebted to my colleague Dr George Graham for an account of the following patient, a tailor aged 63 who was admitted to hospital with a haemoglobin count of 35 per cent four days after the onset of haematemesis and melaena. He was immediately given 1800 ccm of blood by intravenous drip and his haemoglobin figure rose above 65 per cent. Bleeding apparently continued for at the end of ten days his haemoglobin count had fallen below 30 per cent and he had a small haematemesis. He was given over 4 litres of blood in the next week but owing to recurrent bleeding the haemoglobin content was only 45 per cent at the end of that time. A week later a further small transfusion was given and altogether the patient received 61 litres or more than his whole total volume of blood. He did well and x ray examination ten weeks after the onset showed spasm of the pylorus but no ulcer.

Patients with recurrent bleeding are the only ones of whom we can feel certain that they are likely to die if treated medically. Up to date we have had even more reason to feel certain that they are likely to die if treated surgically. The treatment of recurrent bleeding from the stomach and duodenum is a legitimate field for clinical experiment, and it is the only field in which it is safe to test the new technique of massive transfusion plus operation for haematemesis and melaena. The condition is obvious and introduces none of those difficulties in definition which occur when we attempt to divide cases into mild and severe. The mortality has been so high that desperate remedies are permissible. I have decided not to permit operation on any patient under my care for bleeding from the stomach or duodenum, even though the bleeding is severe or recurrent. I hope that some physicians and surgeons will decide to operate on all cases of recurrent bleeding from the stomach and duodenum which come under their care. If errors of sampling are avoided we shall then obtain reliable figures on which to base our judgements.

Haemorrhagic Shock

Blalock (1936) has made important observations on the effects of haemorrhage in animals. There is transient primary shock after a haemorrhage, but it is quickly overcome and the blood pressure returns to normal unless the bleeding is severe and prolonged, when secondary haemorrhagic shock may appear. The appropriate treatment is to restore the blood volume to normal by transfusion. Fall in blood pressure is a late sign and if the pressure is allowed to remain at a low level for several hours it is difficult, if not impossible, to restore the animal and transfusion is no longer beneficial. Deprivation of food and water exposure to cold and anaesthesia aggravate the shock. In human beings, though death may occur from anoxaemia soon after a severe haemorrhage not infrequently the patient lingers for a few days in a condition of shock or cachexia before succumbing.

Many observers have noted a rise in the blood urea of patients with haematemesis and melaena, but though there is general agreement that the height of the rise is closely correlated with the severity of the haemorrhage the actual mechanism is still obscure. The rise is too rapid to be attributed to starvation or to absorption of protein or toxic substances from the blood effused into the alimentary tract. There is a little clinical evidence that dehydration such as may accompany loss of blood may produce breakdown of body tissues and set up a negative nitrogen balance, but it is at best rather unsatisfactory (McCance, 1936) and in experimental animals there is no increase in urinary nitrogen after a haemorrhage equal to 2 to 3.5 per cent of body weight (Stewart and Rourke 1936). There is therefore no reason to believe that the rise in blood urea after a haemorrhage is due to excessive production of urea or to tissue breakdown, and the negative nitrogen balance is easily explained by the large amount of nitrogen lost with the blood poured into the bowel. There is also no doubt that the blood urea rises after external haemorrhage in which the blood protein is entirely lost to the organism (Meyler 1935).

Dr F. Avery Jones working in my Unit has collected data which clearly demonstrates the rapid rise of the blood urea after alimentary haemorrhage whether initial or recurrent: the slow fall as the blood volume is restored by spontaneous dilution and the more rapid fall when the patient is transfused. The rise is not correlated with

any change in the alkali reserve or in the blood chlorides which are usually normal in these patients. The blood pressure may be normal, the concentration of urea in the urine is high, and the total output of nitrogen may even be increased. I believe that the increase in the blood urea is due to the fall in the blood volume and in the blood flow through the kidneys at a time when the kidneys have the extra work of excreting a large amount of nitrogen derived from the blood in the intestine. But whether it is due to depression of renal function or to extrarenal causes—and this can only be settled by further work—the extent of the rise is a good index of the severity of the haemorrhage. The assessment of severity is by no means easy. The amount of blood vomited or passed through the bowel can rarely be measured. It may be several days after a haemorrhage before the blood volume is restored to normal, and not until then can the loss be calculated from the haemoglobin percentage. The blood pressure and pulse rate may be maintained at a normal level in spite of a copious haemorrhage. It is just in these early stages when judgement is difficult that an estimation of the blood urea is most helpful, and any case in which the blood urea rises above 75 mg per cent must be regarded as severe. This condition of secondary haemorrhagic shock, with its associated rise in blood urea is sometimes described as uraemia, but the blood urea seldom reaches the high levels characteristic of nephritic uraemia.

Transfusion

We must base our attitude to the use of transfusion, morphine the administration of fluid and diet, and other details of treatment on data of this type. Cullinan and Price showed clearly that transfusion does not act as a haemostatic in haematemesis and melaena in fact it may even provoke further haemorrhage when given to a bleeding patient, though it does not provoke a recurrence in a patient who has stopped bleeding. Transfusion should not be used as a routine but should be regarded as the remedy for haemorrhagic shock. It should be employed whenever the pulse rises above 140 the systolic pressure falls below 90 mm, the blood urea rises above 100 mg per 100 c.c. or the haemoglobin falls below 40 per cent. Following these rules I have needed to transfuse only six of my twenty seven patients, but three of these six needed repeated or massive transfusion. I. J. Wood (1936) has shown that glucose saline is much less effective than blood in controlling post haemorrhagic shock and uraemia and I have not used intravenous injections of this nature. I regard morphine as a symptomatic remedy for the alarm induced by the haemorrhage and I do not administer it unless the patient is nervous and restless.

Administration of Fluid

The next question which arises is the administration of fluid. Goldman (1936) gives no fluid at all either by mouth or parenterally during the first twenty four to forty-eight hours on the grounds that fluid will stimulate further bleeding by diminishing the viscosity of the blood and raising the blood pressure. His mortality hardly encourages imitation and I quote this extreme view because it enshrines fallacies which are present in a good deal of medical treatment. It is a mistake to concentrate entirely on treatment of the bleeding and to forget the general treatment of the patient. It is unphysiological to deprive an exsanguinated patient of fluid. There is no evidence that the administration of fluid or pultaceous food by mouth stimulates further bleeding. I tell my students that it is just as bad to let a patient with a

peptic ulcer suffer hunger and thirst as it is to let a patient with a fever be thirsty or a patient with pneumonia be cyanosed

A sick patient requires $3\frac{1}{2}$ litres of fluid a day (Coller, 1936). A patient with haematemesis or melaena has probably lost 2 to 3 litres of body fluid in blood and vomit. He should theoretically receive 6 litres of fluid on the first day and $3\frac{1}{2}$ litres on subsequent days. Nothing like these quantities is given in the usual medical treatment of gastro-duodenal haemorrhage. Half-hearted attempts to give saline per rectum are discouraged by failure of retention or by recurrence of melaena and patients remain for several days dehydrated, dirty-tongued, collapsed, and semi-uraemic. Every surgeon knows that it is possible to give large volumes of fluid intravenously or per rectum so long as the fluids are not irritating and are administered by continuous drip. If large volumes of fluid are given parenterally careful watch must be kept on the blood and urine chemistry to avoid overtaxing the body with chlorides or glucose. The main need after a haemorrhage is for water, and this can be given as tap-water per rectum.

Feeding by the Mouth

If the orthodox medical treatment of haematemesis is employed and food and drink are entirely withheld it is essential to give adequate amounts of fluid parenterally. Both rectal and parenteral fluid necessitates some disturbance of the patient. It is difficult to believe that we rest the stomach by withholding food and drink by the mouth for the strongest waves of peristalsis occur when the stomach is empty: we are all familiar with the hunger-pain and the food-crave of peptic ulceration. I therefore decided to feed patients by mouth as soon as they were admitted to hospital. In making this decision I was naturally influenced by the work of Meulengracht (1934, 1935, 1936) who has now treated an unselected series of 273 patients with haematemesis and melaena due to peptic ulcer by the immediate administration of a bland diet and has had a mortality of only 1 per cent. In one third of his patients haemorrhage from the ulcer had lowered the haemoglobin below 50 per cent. Cullinan and Price had made the same point in 1932 showing that patients who were starved for twenty-four or forty-eight hours were much more likely to bleed again than patients who were fed at once.

TABLE II—Relation of Recurrences to Starvation
(Cullinan and Price, 1932)

Treatment	Cases which Bled for the First Time on the Day of Admission	Recurrence during the First 48 Hours
Starved 24 hours	36	9
Starved 48 hours	11	5
Fed at once	10	1

Meulengracht suggests several reasons for the beneficent action of early feeding. Patients are liable to die from exhaustion and need a diet sufficient in calories and vitamins. He doubts the wisdom of keeping the stomach empty of food and exposed to free gastric juice. Food in the stomach seems to act as a haemostatic: ambulant cases of alimentary bleeding often do well without changing their diet and patients admitted to hospital stop bleeding when they are fed. J. B. Hunter (1935) believes that the free flow of saliva which is produced by feeding further assists clotting. I have referred above

to Blalock's experiments, which show the harmful effects of deprivation of food and water in haemorrhagic shock.

My own diet which is given in Table III is more fluid than Meulengracht's as I was afraid to make too violent a break with tradition but it provides the patient with 2,500 to 3,500 calories a day. The milk is not citrated and is flavoured, if desired with ovaltine bournvita or

TABLE III—Dietetic Treatment of Gastro-duodenal Haemorrhage
Arranged for Two hourly Feeding

Feeds by Day	Food		Day		
			1	2	3 and subsequent
1	Whole milk (fresh or dried)	oz.	5	5	5

8	Whole milk (fresh or dried)	oz.	5	5	5
	Fruit purée	Portion	Portion	Portion	Portion
	Pudding	oz.	—	1	1
Feeds at night (when awake)	1. Whole milk (fresh or dried)	oz.	5	5	5
	2. 1 egg beaten up in milk	oz.	5	5	5
Between feeds	Strained orange or tomato juice	oz.	1	1	1
Approximate caloric value			2,545	3,118	3,624

Horlick's Salt is permitted in moderate quantities but other condiments are not allowed. Vitamin C is supplied in the orange and tomato juice. Marmite is given at least once a day for the vitamin B complex and I also like my patients to have cod liver oil and malt or one of the concentrates of vitamins A and D. Between feeds sips of water, glucose solution or half-strength isotonic saline are allowed in quantities up to 5 ounces an hour. If the patient is hungry he is allowed 5 ounces of milk at the intermediate hours. The total fluid intake averages about 2,750 ccm., and allowing for the water of oxidation the patient is probably provided with some $3\frac{1}{2}$ litres of fluid a day. No medication is given other than liquid paraffin or paraffin emulsion and I deliberately avoid alkalis unless there is epigastric pain—which is of course unusual after a haematemesis. For certain experimental reasons iron has not usually been given early in these cases though in the ordinary way it is both safe and wise to give treatment with iron from the start. To avoid disturbing the patient or provoking fresh bleeding no purgatives are allowed and enemata are postponed till between the fifth and the tenth days. I have described elsewhere how well this deliberate constipation

is borne (Witts, 1937) Unless the patient is collapsed when of course he should be transfused I allow the head to be moderately raised because the patient is more comfortable in this position than in the orthodox complete recumbency and he can take food without swallowing troublesome quantities of air When bleeding has ceased the ordinary indications are followed in raising the diet to the post-Lenhartz level

Results of Diet

I will not pretend that all the patients have been able to take all the diet from the start since some have had nausea and then they have not been pressed to eat I do claim that they look feel, and do much better than any previous series of cases of gastro-duodenal haemorrhage I have seen When haemorrhage has recurred we have encouraged the patient to go on with the diet and have tried to develop the impression that recurrence made the diet all the more vital and necessary What have been the results? I have already described my early case where the patient died after operation One other patient died within six hours of admission, she was known to have cirrhosis of the liver and at necropsy she proved to have in addition a primary hepatic carcinoma The remaining twenty five did well

The results have therefore been most satisfactory, for cases of alimentary haemorrhage which come to a general hospital include the more serious forms and their mortality is higher than the average The increase is not entirely explained by the disturbance of the journey, since there is a similar difference between private and public hospitals in the United States of America where few patients are nursed in their own homes (Ledbetter 1936) It must be attributed to the higher incidence of malnutrition and overwork among working-class patients with peptic ulcer so that they are less able to withstand the effects of bleeding It may be difficult to give adequate treatment such as transfusion in the home and the risks of moving do not outweigh the benefits of hospitalization

Seven of my patients gave a history of previous bleeding Four of them have bled again since I treated them one dying of cirrhosis A few were advised to undergo surgical treatment when they had recovered from their haemorrhage It is not my intention however to discuss the treatment of peptic ulcer in general nor do I need to emphasize what is already common knowledge that a patient who has bled once is likely to bleed again When the patient has recovered from the haemorrhage the case must be carefully reviewed in the light not only of the previous history and the physical examination but also of the information provided by gastric analysis rays and where possible gastroscopy and it must be decided whether further treatment should be medical or surgical The patient is now fit for surgery and the operative procedure can be suited to the pathological findings instead of being dictated by panic

Summary

1 No reliable judgement on the relative merits of operative and non operative treatment of gastro-duodenal haemorrhage can be based on mass hospital statistics

2 The best individual medical results (Meulengracht 1936) are much superior to the best individual surgical results (Finsterer 1936)

3 It is rarely possible to differentiate between an acute and a chronic ulcer in the first forty-eight hours which is the optimum period for surgical attack in haematemesis (Gordon-Taylor 1935)

4 Treatment has been too closely centred on the bleeding point, to the detriment of the patient as a whole Death is more often the result of haemorrhagic shock than exsanguination and orthodox medical treatment by starvation is calculated to increase haemorrhagic shock

5 The results of immediate feeding supplemented when necessary by transfusion are much superior to treatment by starvation or operation

6 A single gastro duodenal haemorrhage is seldom fatal The key to the reduction of the mortality of gastro-duodenal haemorrhage lies in the prevention and treatment of recurrent bleeding There is a legitimate field for clinical experiment in the comparison of operative and non operative treatment of recurrent bleeding

SOME OBSERVATIONS ON THE DICK TEST

BY

FRANK L. KER, B A Camb., M B., Ch B Ed

Senior Assistant Medical Officer Little Bromwich Hospital
Birmingham

In the course of routine work in a large fever hospital where Dick testing is carried out on a considerable number of patients one is constantly meeting with negative Dick tests early in scarlet fever with Dick positive tests during scarlet fever convalescence and occasionally with Dick-negative subjects developing scarlet fever The following investigations were commenced as a result of an unusual run of such anomalous Dick reactions

The Dick test which was introduced as a method of assessing the susceptibility of the individual to scarlet fever was never claimed to be as reliable as its counterpart the Schick test although its accuracy is generally regarded to be very high Experience in English hospitals shows that if a nurse gives a clear Dick negative reaction she is in almost every instance safe against scarlet fever even though working in scarlet fever wards

Factors for Consideration

There are many factors which have to be taken into consideration when testing or comparing different toxins, and the one which probably plays the greatest part in such an investigation is the accuracy with which the toxins are injected Accuracy, in performing intradermal tests is only acquired with constant practice carried out with extreme conscientiousness on the part of the operator to ensure that the whole of the 0.2 c cm used is injected intradermally in such a manner as to produce a good wheal Such a wheal should be about 1 cm in diameter

and be dead white with the pores of the skin shown as small dimples on the surface. Although wheals may vary slightly in different individuals for the purpose of comparing toxins all those in the same individual should be of the same size.

Another important factor due to the transient nature of the reaction in many cases is the conditions under which the results are read. Artificial light does not show up faint positives well and indeed some may be classed as negative unless special care is taken if artificial light is being employed. The best interval to allow between performing and reading the test is probably between twelve and eighteen hours. All the tests recorded below were read at three different intervals—namely, eight, twelve and twenty-four hours after injection. At least one of these readings and in some cases two, was done in artificial light.

The site chosen may be of importance. It is well for anyone who is contemplating doing work of this kind to test his own technique by injecting the same dose of the same toxin at two or three different sites on his own arm or on a dozen available patients, and get a colleague to make the readings without knowing that the same toxin has been used. He will find that the majority of the readings will make all three toxins equal but there will be a good deal of variation in some of the patients and this is not referable entirely to the site chosen—assuming that all injections are done on the smooth surface of the forearm between the elbow and well above the wrist. The best comparison of two different toxins should be made at exactly corresponding sites on the two arms.

Other factors which require consideration are the strength and stability of the toxin. The more dilute the toxin the less well will it keep and the temperature of storage has also to be taken into account as deterioration is more marked at some temperatures than at others. In an attempt to overcome these factors various substances have been tested with a view to using them as stabilizers.

Further questions presented themselves as regard the control fluids. Is there a pseudo Dick reaction? How long does toxin have to be heated in order to destroy the toxin?

With all these factors to be taken into consideration it is obvious that a large series of tests has to be made to be of any value in assessing the merits of one toxin as against another. In an attempt to limit the human error to a minimum all the tests carried out were performed and read by myself. All the readings were measured in millimetres and any difference in intensity of the reactions in the same individual was carefully recorded. Any reaction less than 10 mm in its largest diameter was classed as an unmeasurable reaction.

Two different toxins have been used in the investigations. Toxin A diluted 1 in 1000 was estimated to be of the same strength as Toxin B 1 in 5000. The first series of tests to be carried out were with Toxin A to ascertain its stability to heat and the effect of storage upon it.

Stability of Toxin A to Heat

For the purpose of estimating the heat stability only proven Dick positive reactors were used and each was tested with toxin which had been heated for one, two or four hours respectively. Two out of twenty-two children showed a small reaction at eight hours to toxin which had been heated for one hour while six others did at the same period very small re-

actions which could not have been mistaken for positive Dick reactions. The two that had small measurable reactions to toxin heated for one hour had small unmeasurable reactions to the toxin which had been heated for two hours. No reactions were recorded with the toxin which had been heated for four hours. The minimum time necessary to inactivate Toxin A appears therefore to be four hours.

Stability of Toxin A on Storage

To determine the effect of storage on Toxin A or what may be termed the life of Toxin A four samples prepared on different dates were compared. These were respectively fresh, two, four- and six-month-old toxin which had been kept in cold storage from the date of preparation. No evidence of deterioration was found in the six or four-month-old specimens but slightly smaller reactions were obtained with the two-month-old sample as compared with the other three.

The reason for the apparent weakness of the two-month-old sample was difficult to explain. Only later did we become alive to the bearing on the results of the composition of the stabilizing mixture used.

This series which was carried out using only twenty individuals in each investigation at once raised the question of the difficulties of comparing toxins as mentioned above and the later investigations were carried out as a result on a much larger number of individuals in an effort to reduce error so far as possible.

Comparison of Toxin A and Toxin B

The second series was a comparison of Toxin A diluted 1 in 1000 with Toxin B diluted 1 in 5000 and then with Toxin B diluted 1 in 3000. In the former comparison sixty-five children whose average age was 4.1 years were tested. Of these fourteen were negative to all tests, twenty-two were positive to all tests and the remaining twenty-nine showed a positive to one or other or both toxins at one or more of the readings as follows:

Toxin	At 8 hours		At 12 hours		At 24 hours	
	A	B	A	B	A	B
Number	20	14	22	13	17	4

Generally the reactions to Toxin A were a few millimetres larger than those of Toxin B in the same individual although in a few instances the reverse was true. Toxin A produced sixteen readings which were definitely brighter than those of Toxin B in the same individual while only four were brighter with B than A. The conclusions reached were that Toxin A was the better, that the maximum number of positives were noted at the 12-hour reading and that frequent readings were desirable before the result was read as negative.

When comparing Toxin A with Toxin B diluted 1 in 3000 fifty-three children whose average age was 6.1 years were tested. Of the twenty-six were negative to all readings, fifteen were positive at all readings and the remaining twelve showed a positive reaction at one or more readings to one or other toxin or both as follows:

Toxin	At 8 hours		At 12 hours		At 24 hours	
	A	B	A	B	A	B
Number	2	7	7	5	4	5

The results were practically the reverse of those in the previous series. Toxin B gave the slightly larger reading and in twenty-five instances the brighter reactions. Toxin A was brighter on only two occasions. In these cases measurable reactions occurred with both controls at the eight-hour reading compared closely with the corresponding toxin reactions. Only in one test did they part at the twelve-hour reading and here again they were both equal in size.

presumably this represented a true rare pseudo reaction. None was observed at the twenty four hour reading. The results can be tabulated as follows

TABLE I

Toxin A 1/1 000 >	Toxin B 1/5 000 in 32 instances
" "	" "
" "	" "
" "	" "
Toxin A 1/1 000 >	Toxin B 1/3 000 in 3 instances
" "	" "
" "	" "
" "	" "

The next investigation performed was to test the stability of Toxin B to heat and its life under varying conditions of storage

Stability of Toxin B to Heat

In twenty two cases nine positive reactions all unmeasurable were noted with the toxin heated for one hour and only two with the toxin heated for two hours which compares almost exactly with the figures obtained with Toxin A. The reactions however appeared to persist longer three being still visible at twenty four hours

Stability of Toxin B on Storage

The figures obtained when using Toxin B stored for three months under varying conditions—namely at 4°C at room temperature and at 37°C—showed that there was definite deterioration in all specimens as against the freshly prepared toxin with a slight advantage for toxin kept at 37°C. Twenty-eight children were tested whose average age was 3½ years. Of these five were negative to all tests, five showed slight unmeasurable reactions to one or more toxins at one or more readings, nine were positive to all toxins at all readings and the remaining nine showed a positive reaction to one toxin or more at one reading or more. At twenty seven readings the fresh gave definitely brighter reactions than the stored materials in the same individual while in nearly every case the measurements were slightly greater. The smallest and/or faintest reactions were noted as follows: fifteen were with the toxin stored at 4°C, fourteen with the toxin stored at room temperature and eight with the toxin stored at 37°C.

The results of different workers had suggested that Toxin B was somewhat less stable than A and further investigation was stopped in order to test the effect of adding a stabilizer. Toxin B was diluted 1 in 4 with stabilizer and for the purposes of clarity this toxin will be referred to as Toxin C.

Specimens of Toxin C diluted 1 in 1 000 with boric borate mixture stored at 40°C and at room temperature for six weeks were compared with a freshly prepared toxin of the same strength. Twenty five children average 3½ years were tested and of these three were negative to all tests. The readings showed a very slight superiority of the freshly prepared material over the other two but in several instances the reverse was true. It was difficult to draw any distinction between the 4°C and the room temperature samples because in the majority of cases the difference was less than two millimetres and therefore quite within the limits of personal error. It would appear that Toxin C remains stable for a period of at least six weeks.

Comparison of Toxins A, B, and C

Finally Toxins A, B and C were compared against each other on three different dates. The toxins were all prepared fresh five days before the first group of children were tested and they were kept at room temperature until the second and third groups were tested at intervals of a week. The summary of the results are best expressed in tabular form (see Tables II and III). The numbers in the last group are smaller than the other two on account of the fact that exactly half of the children tested were negative to all three toxins which is an unusually high figure.

In Table II the numbers in the first columns are those in which the toxins gave the largest and/or brightest reactions as compared with the other two in the same individual while the second columns give the percentage of those numbers. It

will be seen that the fresh toxins at 60 per cent of the readings Toxin C gave the best reactions and after they had been kept at room temperature for two weeks this figure had increased to 78 per cent. Toxin B had dropped from 10 per cent to 3 per cent during the same period.

The numbers classified as undecided refer to the readings at which at least two, and in a few cases all three reactions in the same individual were so close both in intensity and measurement that no one toxin could be singled out as superior.

TABLE II—Readings showing the Brightest and/or Largest Reactions

Toxin	Fresh		On Week		Two Weeks	
	No	Per cent	No	Per cent	No	Per cent
A	6	12.5	12	17.4	3	9.4
B	5	10.4	5	7.2	1	3.1
C	29	60.4	45	65.2	25	71.1
Undecided	8	16.7	7	10.2	3	9.4

In Table III the numbers in the first columns are those in which the toxins gave the faintest and/or smallest reactions as compared with the other toxins in the same individual and in the second column those numbers are expressed as percentages. In this table Toxin C falls from 10 per cent of the total when the toxins are used fresh to nil when compared after two weeks and Toxin B rises from 27 per cent. to 40 per cent. The numbers classified as undecided are those in which no toxin could be singled out as inferior to the others. Naturally this group is larger than the corresponding group in Table II as it is much harder to distinguish between two faint tests than two bright ones.

TABLE III—Readings showing the Faintest and/or Smallest Reactions

Toxin	Fresh		One Week		Two Weeks	
	No	Per cent	No	Per cent	No	Per cent
A	16	33.3	22	31.9	9	27.2
B	13	27.1	28	40.6	13	37.6
C	5	10.4	4	5.8	—	—
Undecided	14	29.2	15	21.7	10	31.2

The results show that over the short period there is a progressive superiority of Toxin C with a corresponding inferiority of Toxin B. Toxin A appears to be almost as stable as Toxin C but not quite so potent.

Discussion

The object of the investigation was to find

- (1) How accurately one could titrate one sample of Dick toxin against another
- (2) How stable was ordinary Dick toxin
- (3) If certain preparations of Dick toxin were unstable, could they be stabilized?
- (4) How long the toxin must be heated to destroy toxin and provide a satisfactory control fluid

(1) It is clear from Table I that it is not an easy matter to match two toxins. It is well known that if one is trying to compare two Schick toxins on guinea pigs one would find that if the toxins differed in strength it would about 10 per cent all the guinea pigs would give a reaction in favour of the stronger toxin. Table I shows that when the comparison was made between Dick toxin A 1 in 1 000 and the weak 1 in 5 000 dilution of Toxin B, A was stronger than B, since thirty two out of forty

eight patients said "greater than" and eleven said "equal", but even here five patients out of forty-eight indicated that A was weaker than B—that is 10 per cent gave what is obviously an inaccurate answer. Similarly when Toxin A was compared with Toxin B 1 in 3 000 it is clear that A was weaker than this dilution of B since nineteen patients said so but six out of twenty-five patients gave an inaccurate answer. It is fair to conclude that if one is trying to compare two Dick toxins one must use a larger number of patients probably about fifty before one can get a reasonably accurate answer. This difficulty in matching two toxins and the necessity of using a large number of patients appears clearly from the careful work of Okell and Parish on over 150 patients reported by O'Brien (1930).

(2) Tables II and III indicate that Toxin B was less stable than A or C. Toxin B was a dilution made with the ordinary boric borate solution originally described by Glenn, Pope, and Waddington (1928) and referred to in the *British Pharmacopoeia* (p. 463). This diluted toxin was less stable than the toxin called C in the tables, which consisted of the original toxin first diluted 1 in 4 with a stabilizing mixture and then diluted 1 in 1 000 with the boric borate mixture. Dr H. J. Parish of the Wellcome Physiological Research Laboratories has kindly given me this information and told me that various stabilizing solutions are under test at the laboratories.

(3) Apparently the stabilizer mixture used for Toxin C has given satisfactory results for Tables II and III indicate that the toxin has been potent up to two weeks after dilution and later tests which we made show that six weeks after dilution this "stabilized" Dick toxin gave almost as good results as the fresh material. I understand from Dr O'Brien that this result agrees with the laboratory investigations and some made by other clinicians and that his confident expectation is that this dilution is stable for much longer periods.

(4) The control Dick toxin must apparently be heated for four hours to make quite sure that the toxin is inactivated. With such a solution pseudo-reactions are extremely rare but apparently one does encounter a patient now and then with what must be accepted as a pseudo-reaction detectable only if frequent readings are made. Pseudo-reactors are so rare that one is almost safe in dispensing with the use of the control fluid when testing ordinary patients.

Summary

Different Dick toxins can be satisfactorily matched only if the technique is carefully standardized; frequent readings are made and a considerable number of patients—probably fifty—are available.

A properly stabilized Dick toxin dilution apparently gives when six weeks old virtually as good reactions as when freshly made up.

Dick control fluid should be heated for at least four hours.

Pseudo-reactors are very rare but are encountered from time to time.

I am indebted to Dr J. McGarrity, medical superintendent of the hospital for permission to carry out these tests and for his kindly advice and encouragement, and to Dr R. A. O'Brien of the Wellcome Physiological Research Laboratories for supplying the materials used and for his helpful suggestions.

FURTHER OBSERVATIONS ON THE TREATMENT OF TETANUS

By

B. B. YODH, M.B., M.R.C.P., D.T.M. & H.

Honorary Physician J.J. Hospital Bombay

A study of 229 cases of tetanus, with special reference to the antitoxin treatment was recorded in a previous publication (1932). The following further observations are offered on the results of the treatment of 438 consecutive cases admitted to the J.J. Hospital from 1931 to 1935 inclusive.

Numerous papers have been published since 1932 in which the value of intrathecal injection of the antitoxin by cisternal puncture has been seriously questioned. The majority of workers advocate large doses intravenously in the early stage. Cole (1934) in a recent paper mentions that the incubation periods of our previous series were not given and that serious cases were excluded. It may be pointed out that the incubation periods of all cases were tabulated in the paper and the total mortality rate, including all serious cases was given. The mortality rate, after deduction of cases resulting fatally within twenty-four hours of admission was only a part of the tabulated results. The period of onset which was not worked out in the previous series, has been included in the present one.

Recent work on the treatment of tetanus has proceeded mainly along two lines: the control of the exhausting spasms by the use of among other things curare and basal narcotics; secondly the administration of a large initial intravenous dose of antitoxin. The following conclusions were reached in the previous paper:

1. That the use of tetanus antitoxin was rational and necessary.

2. The combined intrathecal (by the cisternal route), intravenous intramuscular and subcutaneous method gave the most promising results.

The present series of 438 cases was treated along similar lines. The antitoxin used however, came from three different manufacturers; the potency marked on the tubes being uniform. The use of sedatives was standardized. Carbolic acid and magnesium sulphate injections were not used. Out of the total of 438 cases 209 (49.4 per cent) were cured, 214 (50.6 per cent) ended fatally and 15 were discharged at request, 127 patients died within twenty-four hours of admission. Excluding these the mortality works out at 29.4 per cent. The corresponding figures for the previous series were 46.4 per cent and 23.4 per cent. It may be mentioned that all the cases of the previous series had one brand of antitoxin.

For purposes of study the cases are grouped in the following tables: I—Age, II—Incubation period, III—Period of onset, IV—Period of onset with the incubation period, V—Type of injury.

TABLE I—Age

Age	1-10	11-20	21-30	31-40	Above 40	Not known
Number	78	89	120	101	44	6
Cured	42 (55.2%)	42 (49.4%)	63 (54.3%)	45 (46.4%)	15 (34.8%)	2 (40%)
Died	34 (44.8%)	43 (50.6%)	53 (45.7%)	53 (53.4%)	28 (65.2%)	3 (66%)

Discharged at request 15

This table corroborates the observation that the prognosis is better up to the age of 30 and then becomes progressively worse very few patients over 50 recover

TABLE II—Incubation Period

Incubation period in days	1-5	6-10	Above 10	Not known
Number	73	78	109	172
Cured	27 (37%)	37 (47%)	68 (62%)	85 (49%)
Died	46 (63%)	49 (62%)	32 (32%)	87 (50%)

Discharged at request, 15

Out of 214 127 died within twenty four hours the incubation period of 58 out of 127 was under ten days and in 52 it was not known, but was presumably short

TABLE III—Period of Onset

Days	1	2	3	4 and above	?
Number	108	85	94	96	55
Cured	44 (41%)	38 (45%)	47 (50%)	62 (65%)	18 (33%)
Died	63 (58%)	46 (54%)	41 (46%)	29 (31%)	31 (66%)
Died in 24 hours	40	25	25	16	21

Discharged at request 15

The previously published series did not contain this table The rapidity of the development of symptoms appears to be the important factor in prognosis

The following tables show the comparison between the incubation period and the period of onset

TABLE IV—Period of Onset with the Incubation Period

	One Day				Two Days			
	1-5	6-10	11+	?	1-5	6-10	11+	?
Incubation period								
Number	24	35	25	24	15	20	17	33
Cured	5 (20%)	12 (35%)	18 (72%)	9 (62%)	3 (20%)	8 (40%)	10 (62%)	17 (51%)
Died	19 (79%)	22 (64%)	7 (28%)	15 (58%)	12 (80%)	12 (60%)	6 (37%)	16 (48%)
Died in 24 hours	14	12	4	10	40	5	7	4

	Three Days				Four Days and Above			
	1-5	6-10	11+	?	1-5	6-10	11+	?
Incubation period								
Number	18	9	27	40	16	12	26	42
Cured	10 (58%)	2 (22%)	14 (55%)	21 (58%)	8 (50%)	7 (63%)	20 (80%)	27 (69%)
Died	7 (41%)	7 (77%)	12 (44%)	19 (47%)	8 (50%)	4 (36%)	5 (20%)	12 (30%)
Died in 24 hours	5	6	7	7	6	2	1	7

Discharged at request, 15

No history was available with regard to the period of onset or the incubation period in fifty five cases out of these eighteen (33 per cent) were cured and thirty five died (66 per cent) Twenty one of these died within twenty four hours two were discharged at request

The tables show that even with a short incubation period if the period of onset has been three days or over—that is if the disease has been developing gradually and is not progressing rapidly—there are many chances of recovery

TABLE V—Type of Injury

	Nail	Septic	No Evidence of Injury
Number	65	248	115
Cured	23 (35%)	134 (51%)	52 (49%)
Died	42 (64%)	116 (48%)	56 (50%)

Discharged at request 15

The deep penetrating injuries such as by nails are more often followed by tetanus, and the cases carry a high mortality

The type of case suitable for judging the results of any method of treatment falls within the groups of incubation periods from one to ten days and the period of onset from one to two days If the mortality rate can be shown to improve in these groups by any method of treatment that method should receive serious consideration In 115 cases no injury or source of entry could be discovered, this is a large proportion Either apparently trivial or unnoticeable injuries may carry the infection, or the organisms that may be present in the lumen of the bowel may become pathogenic Careful cultural examination of the stools of these patients as well as those of the community at large requires to be done if any light is to be thrown on this question of idiopathic tetanus Even when there is no known portal of entry the disease takes a heavy toll as fifty six out of 115 cases showing no evidence of injury ended fatally

Dosage and Mode of Administration

Great difference of opinion prevails among workers regarding the dosage and mode of administration of the antitoxin Taylor (1934) thinks large doses unnecessary, while Miller and Rogers (1935) recommend large doses intravenously Cole (1934) recommends one large dose intravenously and believes that the amount is sufficient to neutralize all toxin that may be present and that may be thrown into the circulation from the focus of infection That some of the antitoxin is present in the blood ten days after administration Cole has proved by animal experiments

In the present series moderately large doses have been used initially 40 000 units intrathecally through the cisterna magna and 80 000 units intravenously and intramuscularly in equal parts Daily administrations of 40 000 to 80 000 units according to the severity of the case intravenously or intramuscularly or both, were given till the spasms were fully controlled It has been noted that premature stoppage of the serum has been followed by a return of the spasms The total dose has often reached 400 000 units or more

Experiments on Guinea-pig

From recent experimental evidence it appears that intrathecal administration of serum does not act on any toxin present in the cerebro spinal fluid for none is found in it We carried out certain experiments in guinea pigs to find out if any toxin was present in the cerebro spinal fluid Serum and cerebro spinal fluid from tetanus patients were injected intraperitoneally into guinea pigs as well as serum from normal persons serving as controls three guinea pigs were used for each case in the beginning 3 to 5 ccm of the serum and 5 to 10 ccm of the cerebro spinal fluid were injected The animals went into spasms from five to ten minutes after the injection of serum from the patients with tetanus but did not develop any spasms after the injection of cerebro spinal

fluid from tetanus patients or serum from the normal controls. This method can be used as a useful test for the diagnosis of tetanus in doubtful cases. 3 to 5 ccm of blood serum from the suspected patient are injected into the peritoneal cavity of a guinea pig, the animal shows spasms jerky movements of the head and body after a preliminary stiffness if the serum comes from a case of tetanus. An earlier diagnosis is thus possible in doubtful cases. The antitoxin in the cerebro spinal fluid therefore acts through absorption in the blood stream. Clinically it controls the spasms better and earlier. This observation is made so often that it cannot be dismissed lightly. It is possible that the absorption is slower and steadier and the effect of the intravenous injection is thus maintained for a longer period. The rate of absorption of the antitoxin from the cerebro spinal fluid into the blood stream and the amount of antitoxin present in the blood from day to day after this injection are well worth study.

Sedatives to Control Spasms

The control of spasms by the use of suitable sedatives is the other problem before workers. A large number of sedatives are being advocated. The patient is in a state of hyperexcitability. All kinds of external stimuli throw him into spasms. The majority of these patients have received paraldehyde per rectum for the control of spasms—4 drachms in 2 oz of saline by the drop method four hourly varied according to the requirements of each individual case. The use of somnifaine by injection or avertin per rectum has been advocated. Several articles have appeared on the use of curarine the alkaloid from curare the arrow poison. This has a paralyzing action on the neuro-muscular junctions. The dose has to be carefully regulated as respiratory muscles are likely to be paralysed if a large dose is inadvertently given. Very efficient nursing is therefore necessary if this drug is to be used as a routine measure. The work of Abel *et al* (1934 1935) may be mentioned here. They have overhauled the older conception of the disease and consider that the toxin has a peripheral action on the neuro-muscular junctions in the muscles themselves. The descending order of the spasms, however has not been sufficiently explained.

Summary and Conclusions

1 A further series of 438 cases of tetanus has been observed with special reference to the use of antitoxin.

2 The combined method of administration of the antitoxin intrathecally through the cisterna magna intravenously and intramuscularly has continued to be used in this as in the previous series.

3 The total mortality of all consecutive cases, except the fifteen that were discharged by request, has been 50.6 per cent and after excluding those that died within twenty-four hours of admission 29.4 per cent. This compares somewhat unfavourably with the previous figures but may probably be explained by the fact that several brands of sera have had to be used in the present group while only one brand was used for the previously published group.

4 The routine use of paraldehyde per rectum is recommended in all cases as the most suitable sedative for hospital patients.

5 The clinical fact that the intrathecal administration of serum through the cisterna magna along with the other routes controls the course of the disease better, estab-

lishes the need for further study of concentration of anti-toxin in the blood serum after intrathecal injections.

I take the opportunity of thanking Lieut Colonel Vazifdar I.M.S. for facilities with regard to the treatment of the patients and my successive house physicians without whose co-operation this work could not have been carried out. I also thank Dr Manohar and Dr Nene for helping me with the guinea pig experiments.

TREATMENT OF MENINGITIS WITH MENINGOCOCCAL ANTITOXIN

BY

J A BROCKLEBANK M.D., M.R.C.P.

Late Assistant Medical Officer Kingston and District
Hospital Surrey

Until recent years the only specific agent available for the treatment of meningococcal meningitis was anti-meningococcal serum but lately there has been produced a meningococcal antitoxic serum* with which a series of four cases was successfully treated at the Kingston and District Hospital during the last year.

This serum is the result of the work of Dr N S Ferry who with his associates investigated the properties of broth filtrates of the meningococcus (1931) and showed that specific extracellular toxins were produced with each of the four Gordon types of the meningococcus. Further it was found that animals could be immunized with each of the toxins and true antitoxins produced which when investigated in the case of the guinea-pig and monkey (1932 1934) rabbit (1934) and finally the human being (1935) were shown to have a curative effect against live virulent meningococci, besides a neutralizing one on the specific soluble toxins. These effects were not only specific for the type of meningococcus against which the anti-toxin was produced, but were apparent to a lesser extent for all types of meningococci.

Dr H L Hoyne (1935), in an investigation of a series of eighty five cases treated with antitoxin showed that the mortality was 23.5 per cent as against 45.9 per cent for cases treated with anti-meningococcal serum. After eliminating those cases in which the patient died within 48 hours of admission to hospital the mortality was 9.6 and 29.6 per cent respectively. Dr Hoyne noted that following the use of antitoxin there was a prompt response of the infection and he favoured large doses of 60 to 100 ccm administered intravenously in order that the toxin should be rapidly neutralized. It was recommended that these quantities should be given diluted in twice the volume of normal saline or 10 per cent glucose solution.

The four cases reported below all children were treated with Ferry's serum on these lines and gratifying improvement appeared to follow its use. In two cases meningococci were found in the cerebro spinal fluid but in the other two no organism was identified. In each case there was a rapid improvement in the general condition of the child associated with a decrease in the number of leucocytes in the cerebro spinal fluid. The antitoxin was given

* By Parke Davis and Company

undiluted intrathecally and intravenously in all four cases, two of which developed a well marked serum reaction on the tenth day

From the hospital records as far back as 1928 there appear to have been only six proven cases of meningococcal meningitis of which five were treated with anti-meningococcal serum. All the cases ended fatally, the longest survival period being sixteen days. It is our impression that the use of antitoxin exerts a favourable influence on the prognosis of meningococcal meningitis and that administration by the intravenous route is the most advantageous.

Case I

A girl aged 13 developed generalized headache and persistent pain in the neck which was becoming gradually worse and was admitted to hospital on the eighth day. She then presented a typical picture of meningitis with very marked head retraction. The temperature was 104° F and the pulse 100. The cerebro spinal fluid was under greatly increased pressure and milky in appearance containing 2990 cells per cmm all of which were neutrophil and from a later specimen meningococci were obtained. Daily lumbar puncture was performed under light ether anaesthesia as it was found that this gave a rather better flow of cerebro spinal fluid moreover the child preferred it to local anaesthesia. Antitoxin was given 30 ccm intrathecally on the first day and 90 ccm on the sixth day followed by 110 ccm on the next three days. The cerebro spinal fluid was normal by the thirtieth day the child having made a complete recovery.

Case II

A boy aged 14 had been ill for one day prior to admission with rapidly developing headache abdominal pain and delirium. His general condition was very bad temperature 96° F pulse rate 62 delirious and with well marked head retraction. The spinal fluid was under greatly increased pressure very milky in appearance and contained 100 000 leucocytes per cmm while a stained film showed many organisms morphologically identical with meningococci. Failure to culture these organisms was thought to be due to the fact that the laboratory was some distance away. Repeated spinal puncture was performed under ether anaesthesia and a total of 134 ccm of antitoxin was given intrathecally and 163 ccm intravenously during the first sixteen days. The number of cells in the cerebro spinal fluid gradually fell in association with an improvement in the boy's general condition, and on the twelfth day there were 95 per cmm all lymphocytes while the fluid was normal on the twenty fifth day. The patient made an uninterrupted recovery and there were no sequelae.

Case III

A girl aged 10 had been unwell for three days before admission with severe headache vomiting and general pains in the back and limbs. Her condition was very poor the temperature was 102.4° the pulse rate 110 and she was very irritable with some head retraction and pronounced neck rigidity. Kernig's and Brudzink's signs were strongly positive. The spinal fluid was under increased pressure and milky in appearance and contained 7000 leucocytes per cmm. No organism was ever identified. Repeated spinal puncture was performed under ether anaesthesia and large doses of antitoxin given intravenously 90 ccm on the first day 60 ccm on the second and 30 ccm on the fourth. From the third to the ninth day a total of 85 ccm was given intrathecally. The child became apyrexial by the seventh day and the cell count in the cerebro spinal fluid slowly fell to normal by the twenty seventh day. There were no sequelae and recovery was complete.

Case IV

A girl aged 15 was suddenly taken ill with severe occipital headache and increasing unconsciousness vomiting and involuntary movements of the limbs. She was admitted twenty-

four hours later when her temperature was 97.4° and pulse rate 80. She was unconscious jaw spasm was present and neck rigidity was marked. The limbs were flaccid Kernig's sign was positive and there was a slight strabismus. Lumbar puncture revealed a very turbid white fluid under a pressure greater than 300 mm of cerebro spinal fluid which showed a count of 9120 cells per cmm all polymorphonuclears. No organism could be identified. A dose of 80 ccm antitoxin was given intravenously and lumbar puncture performed under ether anaesthesia each day. On the second day in hospital the patient slowly returned to consciousness and her temperature rose irregularly to 103.2°. Antitoxin was given intravenously and intrathecally for the first thirteen days, the amounts totalling 405 ccm and 200 ccm respectively. By the middle of the third week she was apyrexial and the spinal fluid showed a normal cell count by the thirty second day. The strabismus disappeared slowly and by the seventh week she appeared to have made a complete recovery.

I wish to record my thanks to the late Dr P Vernon Davies medical superintendent of the Kingston and District Hospital for permission to publish notes of these cases and to Dr E C Warner consulting physician to the hospital for valuable advice and criticism.

A NOTE ON THE EXAMINATION OF TUBERCULOSIS HOME CONTACTS

BY

G GREGORY KAYNE, M D M R C P., D P H

*Deputy Medical Superintendent, Middlesex County Sanatorium
 Clare Hall late Dorothy Temple Cross Research
 Fellow in Tuberculosis*

It is no longer disputed that there is a greater incidence of tuberculous disease in contacts of persons suffering from pulmonary tuberculosis than in the general population. This is admitted independently of any views that may be held on the mechanism by which the disease develops in the contacts whether it is primary infection or reinfection (endogenous or exogenous) or whether it is due to superinfection or to lowered resistance associated with poor economic circumstances in the family of a tuberculous adult. But much difference of opinion still exists on the extent of this increase in incidence in contacts as a whole and in contacts at various ages. Nor is the significance of latent tuberculous lesions as yet fully appreciated.

The subject of contact examination came up for discussion recently at the annual conference of the National Association for the Prevention of Tuberculosis (1936). It was then stressed by some speakers that active pulmonary tuberculosis in children was uncommon although it was stated with insufficient emphasis that latent lung lesions and active foci in other organs occurred in an appreciable number of children in addition. One speaker pointed out that the supervision of all contacts was not a practical proposition at present. Basing himself on an index of 2.5 (according to the 1931 census the average size of the London family was 3.46 persons) and assuming that it was necessary to follow up 1 contact for five years he calculated that this would mean in London the supervision of about 65 000 people. Arguing on the relative frequency of active pulmonary tuberculosis in children he urged that in stead of paying increasing attention to child

contacts we should therefore concentrate on the adolescent group. I have already (1936) pointed out how inadvisable it was to appear to encourage neglect of examination of child contacts. It has since occurred to me that yet another aspect must be considered in this 'worth while' argument—the relative number of contacts at various ages.

The following investigation is not considered extensive enough for forming definite conclusions but it does serve as a pointer and its publication may encourage a similar investigation on a larger scale.

The Investigation

All the patients in the wards of the County Sanatorium, Clare Hall, were interviewed, and information was obtained on the number and ages of the persons in contact with them before admission to the sanatorium. Particular care was taken to ascertain the actual contacts in the home and neither the family nor the house were taken as the unit. This care is necessary because of lodgers and sublet rooms, and in regard to patients living on their own. The results are shown in Tables I to III, they were worked out separately for the men and the women patients so that there might be a slight check on the error of sampling.

TABLE I—Female Patients

69 patients—211 contacts—3.0 contacts per patient

The contacts were distributed as follows

Age	Number	Per Cent
0-5 years	19	9
6-15	35	17
16-30	66	31
31-50	42	20
Over 50	49	23

TABLE II—Male Patients

119 patients—377 contacts—3.1 contacts per patient

The contacts were distributed as follows

Age	Number	Per Cent
0-5 years	30	8
6-15	75	20
16-30	131	35
31-50	70	19
Over 50	71	19

TABLE III—All Patients

188 patients—588 contacts—3.1 contacts per patient

The contacts were distributed as follows

Age	Number	Per Cent
0-5 years	49	8
6-15	110	19
16-30	197	34
31-50	112	19
Over 50	120	20

Comment

There is a close similarity in the figures obtained from the male and the female patients. The figure of three contacts to a tuberculous patient is interesting as showing that the index of 2.5 may be too low in regard to families containing a tuberculous adult. It should be remembered however that in this investigation the home and not the family was the unit as it should be in dealing with contacts and another point to be noted is that at Clare Hall children under 15 were not admitted.

From the figures in the tables I should like to comment on two age groups. A fifth of the contacts are over 50. At first sight the detection of tuberculous disease in these might appear relatively unimportant. This however is not so. For it is in just this group that the primary case might be found—that is the person responsible for the disease in the patient whose contacts are being examined. And the discovery of the primary case is vital as otherwise the removal of the tuberculous

patient from the home will lead to a fool's paradise in regard to the other inmates.

The low percentage of contacts under the age of 6 is of interest in regard to the argument at the beginning of this note. Tuberculosis is a relatively mild disease in children over the age of 5. Moreover the form it usually assumes in them (affecting bones joints and glands) leads to advice being sought by parents spontaneously. There is too the fact that children over 5 come under the supervision of the school medical service. None of these circumstances applies to very young children. In them detection of tuberculous disease or infection and the prevention of infection is of paramount importance (Kayne 1935 1936). The relatively small percentage (8 per cent) of these children in the whole group of contacts would therefore hardly justify a policy that encourages less concentration on the examination of young children on the ground of the alleged large total number of contacts to be examined.

I have to thank Dr F. A. H. Simmonds, medical superintendent for permission to carry out the investigation and Dr John Tate, county medical officer, Middlesex County Council for permission to publish this note.

SEVERE RECTAL INJURIES CAUSED BY AN ENEMA GIVEN THROUGH A RIGID NOZZLE

By

WALTER W. GALBRAITH, M.B., Ch.B.,
F.R.F.P.S. Glas.

Visiting Surgeon, Western Infirmary, Glasgow

Injuries to the rectum following on the administration of a soap and water enema are not common but when they do occur they may be of so serious a nature that I consider the following case should be put on record.

Clinical Record

A married woman, age 56, of somewhat stout build had suffered for many years from chronic bronchitis and asthma. On March 5, 1932, she was seized with a severe rigor during the night. She felt increasingly ill during the next two days when her doctor (Dr W. D. Allan) was called in. He found her to be suffering from bronchopneumonia affecting one lung. Two days later both lungs were involved and she was critically ill. In ten days time she had improved somewhat, but was still very ill. At this time the patient was given an enema by her daughter. An ordinary Higginson's syringe with a bone nozzle as usually supplied by chemists was used. The result of the enema was said to be poor. The patient complained of no pain at the time the enema was given apart from a little rectal discomfort. Following the enema she had retention of urine which was relieved by catheterization and two days later she complained of pain in the rectum. Pyrexia, which was attributed to the chest condition continued. The pain in the rectum was regarded as being due to piles there being no external evidences of any other cause. Eight days later catheterization was still necessary and at that time the rectal pain which had been relieved by a sedative ointment, became more severe. Faecal matter was noticed issuing from the vagina, and there was also incontinence of

faeces. The chest condition improved but the temperature remained elevated (100°). When her doctor noticed the faecal vaginal discharge (ten days after the enema) he made a rectal examination and was horrified to find no trace of the rectum, but instead his finger went into a huge cavity, limited behind by the coccyx and sacrum and in front by the posterior vaginal wall, in the distal part of which there was an opening of a size sufficient to admit the index finger. Dr Allan asked me to see her in consultation that evening. The patient stated that she had had no rectal pain until a day or two after the administration of the enema. When questioned closely she admitted that the enema caused a slight pain, which she attributed to piles, from which she habitually suffered. As the pain did not persist she did not worry about it. She stated that for years she was accustomed to give herself enemata, as she preferred this to the use of purgatives. Her general condition was poor, and I considered that her best chance was to be nursed at home under the care of her own doctor until her chest condition improved sufficiently to warrant her removal to hospital.

On April 16, 1932, the patient was admitted to the David Elder Infirmary (annexe of the Western Infirmary) under my care. On her admission to the Infirmary it was noted that there was still considerable bronchitis and some embarrassment of respiration. She had retention of urine and a continuous oozing of foul smelling faecal and purulent material from the vagina. Rectal and vaginal examination revealed an almost complete loss of the recto vaginal septum and an absence of the posterior wall of the rectum. The examining finger came in close contact with the coccyx and the foramina in the lower part of the sacrum. Temperature, 98.8°, pulse, 92 respirations, 22. On April 22, 1932 a colostomy was performed. During the operation the lower peritoneal cavity was explored but no abnormality was noted. The colostomy was opened two days later. Following the colostomy the patient made an uninterrupted recovery. The retention of urine was relieved within a day or two, and in fourteen days the recto vaginal fistula had healed. The cavity behind the rectum discharged pus for several weeks but ultimately it closed. The patient was discharged from the Infirmary on June 28, 1932 when it was noted that within the anus there was only a narrow track which was lined by granulation tissue and which would not admit a finger.

The patient has reported from time to time and when last seen a few weeks ago she appeared to be in good general health. She had no asthma or bronchitis and the chest appeared healthy. There was still a small amount of discharge issuing from the anus into which a finger could not be inserted. A sinus evidently existed between the end of the pelvic colon and the anus. She had good control of the colostomy wound which functioned twice daily.

Other Cases

I was called in consultation to see this patient within a few weeks of reading an article by H. H. Rayner (*British Medical Journal* 1932 1 419) in which he described a case in many ways similar but in which the injury was of less extent. I had meant to put this case on record at the time but thought that I should observe the patient for a year or two with a view to ascertaining the final condition following on the injury. At a meeting of the North of England Obstetrical and Gynaecological Society on December 17, 1929 W. W. King (Sheffield) reported a case and subsequently, in the discussion which followed, four similar cases were mentioned by others (*British Medical Journal* 1930 1 113). These communications all referred to injuries caused by enemata immediately before or after labour. Denham Pincock (*Lancet* 1937 1 205) refers to two cases similar to the one above described but in his cases the injury was not so extensive or the history so peculiar.

The rigid douche or enema nozzle can hold such potential dangers that its use should never be permitted under any circumstances, and more especially in the hands of the patient, his friends, or even a nurse.

I desire to express indebtedness to Dr W. D. Allan for his notes about the patient both before her admission and since her discharge from hospital.

Clinical Memoranda

Carcinoma of Rectum in a Youth of 18

The following case seems worthy of record by reason of the patient's age.

A youth aged 18 years consulted me in the late summer complaining of diarrhoea of sudden onset. There was no previous history of diarrhoea and a kaolin mixture was given. There was some improvement, and the medicine was repeated five days later. He was seen again nine days afterwards the diarrhoea having recurred after transient improvement. The rectum was examined and a hard mass was felt three and a half inches from the anus, the tip of the finger slipping over the hard edge into a deep ulcer crater.

Laparotomy was performed that day. The liver was found to be free from secondary growths but there was a hard mass the size of a walnut in the pelvic mesocolon one inch below the sacral promontory. There was a suspicion of a dimpling of the peritoneum covering the left side of this small mass. A left inguinal colostomy was performed and the colon was opened on the third day. Ten days later under spinal anaesthesia an abdomino-perineal excision of the rectum was performed (Miles's technique). When the abdomen was opened the bladder was found to be full in spite of the fact that the patient had passed water before coming to the theatre. Difficulty was experienced in catheterizing him because the growth was deforming the base of the bladder which organ was pulled downwards and forwards in that region presumably by contraction of surrounding tissues. The bladder was emptied by a silver catheter. The operation was completed by lining the large subperitoneal cavity with oiled silk and plugging with vaseline gauze which was renewed on the fifth day and discontinued on the eighth day.

He was allowed home on the tenth day the large cavity being irrigated daily with a pint of cold eusol. Walking was allowed on the twenty-third day the perineum was completely healed eight weeks after operation. He was certified fit for work twelve weeks after operation.

Massive doses of iron (50 of ferri et ammonii cit daily) were given and it was found that not only did the patient gain strength rapidly but the management of the colostomy was thereby facilitated in that the stools were well formed and had very little odour. All that was necessary was to cut a hole the size of the spur in a piece of lint which was laid on the abdomen a vaselined piece of lint was laid on the spur. When he was dressed the formed stool had been deposited on the lint and the whole was removed and burnt forthwith. Very seldom was the skin of the abdominal wall soiled. The skin was kept in perfect condition by a zinc borate and french chalk dusting powder.

The pathologist's report proved the growth to be an adenocarcinoma. The hard mass in the pelvic mesocolon proved to be a lymphatic gland invaded by growth.

CONCLUSIONS

1 Before operation for excision of the rectum the bladder should be emptied by catheter.

2 During the nursing period the colostomy is best managed by giving large doses of the scale preparation of iron.

PRINCIPLES OF MEDICINE

Principles of Diagnosis Prognosis and Treatment 4 Triology By Robert Hutchison M.D., LL.D., FRCP Second edition. (Pp 53 3s 6d net) Bristol J Wright and Sons, London Simpkin Marshall 1937

Medical Diagnosis Some Clinical Aspects By S Levy Simpson M.A. M.D. MRCP (Pp 256 10s 6d net) London H. K. Lewis and Co 1937

It is now nearly ten years since Dr Robert Hutchison collected into a small volume his essays on the principles of diagnosis, prognosis and treatment. With the lapse of time a new edition has been called for, but the author has found need for only minor corrections and alterations in a book which is packed with wisdom from the ripe experience of a learned physician interspersed with the dry humour of the North. It is perhaps caviare for the student but practitioners will enjoy and benefit by its perusal, whether they are just beginning their professional career in a spirit of high hope fresh from the schools with the latest information and most recent laboratory teaching or resting for a moment from the whirl and exigencies of practice or losing faith from weariness. For each there will be a stimulus in these wise words.

Dr Hutchison's aphorisms on diagnosis are quoted with approval in a new book of the General Practice Series on the clinical aspects of medical diagnosis by his former student Dr Levy Simpson and those who follow the principles laid down are bound to find much for which to thank both teacher and pupil. The value of an adequate history is emphasized forbearance and tolerance while listening to the patient's recital are necessary, and give an opportunity for assessing the patient's make up. Questions are often needed to keep the garrulous to the point or to encourage the diffident, but they must be put in such a way that suggestions of a false symptomatology are not implanted in the patient's or doctor's mind. The examination should be made with care and thoroughness. Perhaps the greatest difficulty is weighing the evidence. Here experience and judgement are needed to assess rightly the results of clinical and laboratory investigations. A further source of trouble is to determine the proportion of organic and functional elements in the case. A patient may reserve to himself the right to emphasize even to exaggerate a symptom in order that it may not be passed over. It is the doctor's duty to see that proper weight is given to it, seeing it in proper perspective and catching out the malingerer. Dr Levy Simpson has collected into systematic chapters the main diagnostic features of diseases of the cardiovascular, respiratory, digestive and excretory organs. Under a convenient heading of the acute abdomen practitioners are instructed in the features of the medical surgical and gynaecological conditions which bring about an abdominal emergency. Diseases of the nervous system, blood, endocrine glands and the specific infectious diseases are sketched and a short note is appended on the aspects of disease in children. Readers will find the descriptions clearly given so that the elements of effective differential diagnosis are well set out.

BACTERIOLOGY FOR THE STUDENT

A Textbook of Medical Bacteriology By R. W. Fairbrother D.Sc. M.D., MRCP (Pp 437 illustrated 15s net) London W. Heinemann 1937

In the present state of the medical curriculum ancillary subjects are given only a short time allowance in the clinical years, and the teaching must be of high standard

if it is to retain the interest of the student and at the same time cover the ground adequately. The most sought after textbooks are those which combine adequacy of content with brevity: there are limits to the demands which they can successfully make on either the mind or the purse. To produce a good book fulfilling these conditions is not easy but Dr R. W. Fairbrother has succeeded in this manual. Its outstanding merit is that the proper scope and functions of the science of bacteriology are recognized throughout: this is almost the same thing as to say that it affords sound teaching of general principles which is more than can always be said of works of this size or indeed of some larger ones.

Chapters on the general biology of micro-organisms and on the problems of infection and resistance occupy about one third of the book and the bulk of the remainder is descriptive technique being dealt with in only a few of its aspects at the end. This generally speaking is as it should be: no properly taught student need read about details of technique. Nevertheless in some chapters further directions on practical methods would form a useful addition: for example there are no instructions for treating material containing tubercle bacilli preparatory to cultivation a proceeding which is now quite commonplace. This criticism does not imply that the practical applications of bacteriology to clinical medicine are neglected: diagnostic and therapeutic measures are fully considered in relation to each infection. Exposition is clear but to the student some passages will probably be obscure owing to the use of terms which have not previously been explained and he will be well advised only to read some of the earlier chapters after studying the subjects of later ones. The only other criticism called for concerns the illustrations: of these there are too few in the descriptive section, four species alone being figured. The book obviously owes much to a well known work on a larger scale which it resembles in many ways: the author's indebtedness to this work is acknowledged.

THE TSETSE PROBLEM

Die Tsetsefliegen Ihre Erkennungsmerkmale Lebensweise und Bekämpfung Ein Leitfaden für die Praxis By Dr F. Zumpt (Pp 149 121 figures 15 plates RM 9 geb RM 10 50) Jena G. Fischer 1936

This book deals with all aspects of the tsetse problem. The general morphology of the group receives fourteen pages and twenty one text figures. Most of these figures are taken from earlier books; among them is one intended to represent the birth of a larva, and it actually shows the production of a small abortion. The notes on collecting which follow are intended to be understood by readers who have had no entomological training. The most important part of the book is the systematic section (sixty four pages) in which the methods of identifying every species and subspecies of *Glossina* are described: good clear diagrams of the male and female genitalia accompany the text in all cases. The results of recent systematic studies in various countries are thus made readily accessible to those who work in tropical countries where no libraries are available. There are brief ecological notes for each species.

Fifty pages are devoted to general natural history or ecology: descriptions of technique used in research and control methods. Though this information is up to date and clearly put so that it forms a useful introduction to the subject it is hardly detailed enough to be useful by itself to the field worker. However anyone with experience of the tsetse literature will readily forgive a writer who errs on the side of brevity. Unfortunately Dr

Zumpt appears to have little personal experience of control methods so that in his condensed account he gives undue prominence to fly trapping (which fills half the space devoted to control) although that method now seems of doubtful value in most areas. The bibliography has about 650 references, almost all dealing directly with the tsetse fly.

ORTHOPAEDIC SURGERY

Recent Advances in Orthopaedic Surgery. By B. H. Burns, B.Ch., F.R.C.S. and V. H. Ellis, B.Ch. F.R.C.S. (Pp. 296. 108 figures, 15s.) London: J. and A. Churchill. 1937.

To write a book on recent advances in orthopaedic surgery is no easy task. There is not yet complete agreement as to what conditions are covered by this anachronistic term and recovery from some of the lesions commonly dealt with is such a tedious business that by the time an innovation has by long trial been acknowledged as a real advance it can no longer be called recent. For the reason that the treatment of fractures would require a volume to itself, Mr Burns and Mr Ellis have wisely avoided this subject. It is clearly hard enough to cover the rest of the ground in a book of three hundred pages.

There is abundant evidence that the authors have not only read widely, but have assessed the merits of numerous so-called advances with considerable care, and their selection of material is, on the whole, excellent. The flavour of the book is unmistakably British (some may even accuse them of favouring London), but this is in no way blame-worthy since opinions based on personal observation must always be rated higher than those based on reading alone. Free use has been made of quotation and abstract from many papers including useful contributions of their own, and in certain chapters, notably those on the shoulder and the spine the result is most pleasing.

The opening chapters on theories of bone growth, the principles of transplantation of bone, and the chemistry of bone show that orthopaedic surgery has not only sought guidance from the work of the physiologist, but often has stimulated inquiry into problems that had never before been studied. The pity is that these chapters are so drastically condensed. Although there are still great gaps in our knowledge of the cellular processes in bone formation, and of the way in which calcium is moved about the body, the advances made in recent years are of fundamental importance. The physiology of muscle is not referred to perhaps because the clinical application of much that is known is still so defective.

Bone tumours are dealt with very properly on the basis of the excellent work that has been done in America. The chapters on tuberculous disease of joints will commend themselves to almost all European surgeons and the authors' preference for conservative treatment, with arthrodesis reserved merely for the stabilization of the healing lesion, is supported by excellent arguments. The erythrocyte sedimentation rate is mentioned as of value in assessing the progress of the disease as this is a very recent advance it would have been wise to give the authority for this statement. A valiant attempt is made to deal with painful shoulders, Codman of Boston is the pioneer in this field, and good use is made of his recent work. This chapter, though not easy reading, is perhaps the best in the book. The dreariness of the discussion on "low back pain" is not so much the fault of the authors as of the inadequacy of our present knowledge of this mainly symptomatic group of complaints. By contrast the sections dealing with adolescent kyphosis, spondylolisthesis and Pott's disease are most encouraging. The

advance on these fronts has been considerable during recent years.

It is, unfortunately, necessary to draw attention to lapses from the high standard that the authors have set themselves. Chronic (non-specific) arthritis is allowed only one page. The diagnosis of proliferative arthritis is positively secured by tissue examination and the finding of focal collections of lymphocytes in the marrow and synovial membrane. True, no doubt, but there must be some easier way of doing it—and this is all we are told about diagnosis. The whole subject of chronic joint disease should have been reviewed, it would have meant increasing the size of the book, but its value would also have been enhanced. Here and there curious statements appear. Under acute osteomyelitis it is stated that 'the discovery of lipuria may modify the treatment of the focus'—no word of explanation follows. On page 204 we read 'The posture is maintained by muscular tone, and when this is caused by fatigue the strain falls upon the ligaments.' From the context it is possible to find out what is meant, but the sentence as it stands is nonsense. The illustrations, with two exceptions are well done. But if Denis Browne's splint is so good (and we agree that it is), it should have been allowed several small photographs instead of two fourth-form drawings.

Nevertheless this is an excellent book, a worthy addition to Messrs Churchill's now famous series. If, and only if the reader has some previous knowledge of the subject he will enjoy finding here a balanced and interesting account of the best of the recent work that has been done in this great branch of surgery. Orthopaedic surgeons of experience will learn at least a few things that they did not know before, and will no doubt find expressed a few opinions with which they violently disagree. The book deserves a wide circulation.

FACTORS IN SAFE CHILDBIRTH

Safe Childbirth. The Three Essentials. (1) Round Brim (2) Flexible Joints (3) Natural Posture. By Kathleen Olga Vaughan, M.B. (Pp. 150. 49 figures. 7s. 6d.) London: Baillière Tindall and Cox. 1937.

Dr Kathleen Vaughan's well known interest in maternal welfare has led her to work for many years at the problem presented by the high maternal mortality in civilized countries. The outcome of this work is this interesting monograph to which Dr Howard Kelly, the veteran professor emeritus of gynaecology in the Johns Hopkins University, has written a foreword. Dr Kelly sounds no uncertain note for he speaks of the enormous culpable losses due to our utterly uncivilized treatment of expectant and parturient mothers.

Dr Vaughan's thesis is that 'civilized women have more difficult labours than the uncivilized' because civilized conditions of life both European and Indian lead to stiffening of the pelvic joints and flattening of the pelvic brim. In the primitive woman the pelvic brim is believed by the author to be always round and the pelvic joints remain flexible as a result of hard physical work and an open air life. The flattening of the pelvic brim occurs between the ages of 11 and 15 and converts the round outline seen in the child into the oval shape which has hitherto been regarded as a sex difference between the male and female pelvis having its origin in foetal life. Incipient rickets is believed to play an important part in the change. Interesting arguments are adduced in support of this view which appears to have been first suggested to the author by her experience among Indian women living under the Purdah system, and the native women of Kashmir.

In speaking of primitive races whose women have a round pelvic brim Dr Vaughan says 'all these people bore their children safely in primitive conditions. As it stands this statement is too sweeping and is of course incapable of proof. A contrary instance from patriarchal times is that of Rachel who died in giving birth to Benjamin after a hard labour. The oval brim in addition to causing prolonged suffering to the mother endangers the child, and consequently 'many of our finest children are squeezed to death. What hope Dr Vaughan asks can there be of race improvement under such conditions?

The remedial measures advocated display great courage: they are primarily an open air life and controlled physical exercises for all girls in childhood, so that the round brim may be preserved and the pelvic joints remain flexible. Secondly what is known as the usual obstetric position should be abandoned and women should be delivered in the squatting position—that is, sitting on the heels—or in the kneeling position with the spine dorsiflexed and the arms extended. These postures are shown in a series of photographs of an attractive modern young woman who is not pregnant.

Dr Vaughan's complete detachment from the point of view of the English mothers of the twentieth century is shown by the fact that she makes no mention of anaesthetics or analgesics in labour. Her outlook is one of sturdy independence and for this she cannot be too highly commended.

BASAL-NARCOSIS AND ANAESTHETIC COMPLICATIONS

On the Incidence of Anaesthetic Complications and their Relation to Basal Narcosis. By C J M Dawkins M.A. M.D. B.Chir. D.A. (Pp 56 3s 6d net.) London John Murray 1936.

The giving of an anaesthetic for a surgical procedure is unfortunately not without its risks. In this little volume Dr Dawkins outlines the complications attendant upon anaesthesia, and discusses the part played by basal narcotics in their production. In doing so he has analysed three sets of figures. One set deals with his own personal cases and the other two are compiled from various hospital records. The first of these covers the years 1921-5 before basal narcotics were used, and the second group covers the period 1931-5, after their use had become established.

Dr Dawkins has endeavoured to show that the giving of a basal narcotic before an anaesthetic definitely increases the risk of complications and cannot therefore be regarded as an advance in anaesthesia. It is doubtful whether the majority of anaesthetists will agree with this rather pessimistic conclusion. Basal narcotics are still serving a useful purpose in allaying pre-operative fear and will doubtless continue to do so. It is however good for all anaesthetists and surgeons to be reminded of the pitfalls connected with their labours and herein lies this book's chief merit. Dr Joseph Blomfield has contributed a short foreword.

Notes on Books

A Crab Was Crushed is the apposite title chosen by HARVEY GRAHAM for a novel based upon cancer research (Rich and Cowan 7s 6d). The plot is highly original and the tenuous love interest is completely subordinated to the excitement and vicissitudes of the scientific quest. The author succeeds in presenting his characters and their setting in a remarkably lifelike way and he gives an

excellent description of the daily routine in a large provincial teaching hospital which many medical readers will think they can identify. The book although it abounds in medical and scientific terms is presumably written for the lay and it will convey to them some idea of the widespread ramifications of patient labour upon which successful research must depend. It will also open their eyes to the very real danger of indiscriminate addiction to potent proprietary drugs. The novel ends on a dramatic note, and may be described as a scientific thriller.

Physic and Fancy by Dr CHRISTOPHER HOWARD (Hutchinson 6s), is a series of sophisticated comments and observations described as thoughts philosophy and medical facts from a physician's notebook. The author confesses that he has only been in practice for ten years, and it is therefore surprising to note his confident dogmatism on medical matters. Nevertheless the book shows evidence of wisdom and common sense and it is obvious that the author forms his own judgements uninfluenced by textbooks or preconceived ideas. Anaesthesia religion diet, cosmetics—Dr Howard is ready to give an opinion on any of them and on a host of other subjects. He disapproves of the modern trend of cosmetics and feminine adornment and cites nipple rings as almost the only ornaments of a past age which have not yet recaptured popularity. This is an amusing and clever book, though perhaps a little too consciously clever.

Preparations and Appliances

A METAL STRETCHER

A disadvantage of the ordinary stretcher of wood and canvas to which attention has been drawn recently is that it readily absorbs poison gases of the mustard type and if thus contaminated becomes a source of grave danger. The Clyde built stretcher is made entirely of metal and will not readily be contaminated by fluids or gases.

If it does become contaminated it can be completely sterilized. A further advantage claimed by the makers is that it can be stored indefinitely in any dry place without deteriorating. Its weight does not exceed that of a standard wooden stretcher. Particulars and prices may be obtained from the makers Cockburn and Co. Ltd 130 Howard Street, Glasgow C1.

SURGICAL HOSE

Elastic stockings have long had some place as auxiliaries in the treatment of varicose veins. Academic surgical hose is made with lastex yarn which gives what is commonly described as a two way stretch. The stockings have in addition a patented heel which compares favourably with the old type of elastic stocking in which the heel was cut away completely in giving a fixed point from which a uniform tension can be exerted. The stockings are seamless and washable and are made in two styles—full length and knee length and three sizes—small medium and large. The stockings can if necessary be made to special measurements at a slightly increased cost. Inquiries should be addressed to the Academic Depot, Mappin House 158-162 Oxford Street W1.

THE FIGHT AGAINST LEPROSY

The report for 1936 of the British Empire Leprosy Relief Association states that the policy of this body which was originally concentrated upon the treatment of the disease is now mainly directed towards effective isolation and more especially to the safeguarding of young children from contact with infective lepers. Another important objective is the education of the community with a view to improving their sanitary and general condition. Although in many countries voluntary isolation has long been carried out in accordance with tribal custom it is the harmless crippled cases who are isolated while the infectious cases mix with the populace, including the children who are particularly susceptible to infection. It is the object of the anti leprosy worker first to gain the confidence of the people then to study their customs with regard to leprosy, and finally to amend such customs so that they may effectively control the disease. The report states that the chief hope of the ultimate eradication of leprosy lies in educating the people at large in the nature of the disease and in the means of prevention using the leper settlements as centres of such education and training. By these means the people may be made leprosy conscious so that they will themselves insist on the isolation of dangerous lepers and on the observance of preventive measures.

With the collaboration of Toe H the Association has sent several volunteers to Nigeria to work on these lines. More men are urgently required but the necessary funds are not at present available. In the early part of the year Dr Ernest Muir, medical secretary of the Association, visited Nigeria the Gold Coast, and Sierra Leone to study the leprosy problems of these colonies at first hand and to make suggestions for further development of anti leprosy work. Since it is estimated that there are some 200,000 lepers among the twenty million inhabitants of Nigeria the problem of effective isolation is naturally one of considerable difficulty. A more extensive formation of clan settlements already successfully established in some districts is advocated in addition to educative campaigns in the villages accompanied by the provision of treatment centres.

Objectives of the Campaign

The annual general meeting of the Association was held at the India Office on April 15 with Viscount Halifax the president in the chair. Following a general survey of the year's work by Sir William Peel, chairman of the Executive Committee, the meeting was addressed by Dr Muir who discussed the objectives of the Association. He arranged these under four heads: (1) the study of leprosy and of the conditions under which it exists and spreads; (2) helping the leper by care, treatment and training; (3) combating leprosy with a view to its final control; (4) interesting, rousing and educating the British public in the problem of leprosy.

Dr Muir said that leprosy must be considered largely as a child problem for those infected in early years furnished most of the severe and infectious cases which spread the disease to the next generation. From the therapeutic point of view, although medicines were useful, the main remedy lay in healthy occupation and sound nutrition. To succeed in effective treatment and in limitation of infection the lepers themselves must co-operate and to attain this end devoted personal service was needed. With this co-operation secured, intelligent patients could be trained in well-equipped and well-staffed settlements during their treatment so that on recovery they could actively assist in the anti leprosy campaign in the villages.

In conclusion Dr Muir stressed the need for more support from the British public. Interest had been stimulated by the Leprosy Exhibition which was shown at eleven centres during the year and it was hoped to form new branches of the Association in Manchester and other Northern cities. Leprosy was a problem of Colonial development and it was incumbent upon the British nation which had undertaken responsibility for the backward races inhabiting certain of its overseas

dependencies, to make every effort to control and eventually eliminate a disease which caused widespread suffering and distress among these people.

Sir William Peel, moving the adoption of the annual report, said that the Association met that day for the first time as an incorporated body—a company limited by guarantee. Lord Halifax announced that the King had become Patron of the Association thus showing his interest in and approval of its work.

BRITISH EMPIRE CANCER CAMPAIGN

In the absence of Viscount Hailsham, Sir Cuthbert Wallace, President of the Royal College of Surgeons of England, presided at the quarterly meeting of the Grand Council of the British Empire Cancer Campaign held on April 12.

The council was informed that the Campaign would move into its new offices at 11 Grosvenor Crescent next door to the present offices on May 1. The following grants, totalling £2,900, were made in addition to the bulk grants of last November and January: £1,000 to be placed at the disposal of Dr F. Dickens, director of research of the North of England Branch of the Campaign at Newcastle for the continuation of the special short wave investigations being carried out under his direction on behalf of the Scientific Advisory Committee at headquarters; £1,200 for the purchase of a plaque of radium in use by Dr F. G. Spear at the Strangeways Research Laboratory, Cambridge; an additional grant of £300 for the year 1937 to the Westminster Hospital; an additional sum of £300 to Mr F. C. Pybus for the salaries of his assistants and expenses during the second half of 1937; and a grant of £100 to Dr L. H. Gray at Mount Vernon Hospital in connexion with the neutron investigations.

Grand Council unanimously ratified the scheme for closer collaboration between the autonomous branches of the Campaign and headquarters—namely the North of England Council, the Yorkshire Council, the Birmingham Council, and the Lancashire, Cheshire and North Wales Council. It was reported that the fourth biennial informal conference of research workers, surgeons, physicians and radiologists had been a great success and the confidential sessions had been attended by over 400. Sir James Walton, K.C.V.O., F.R.C.S., was elected a member of Grand Council.

J. L. Dorsey (*Ann. intern. Med.* November 1936, p. 628) maintains that the first requisite in the cure of the tobacco habit is that the patient, whether for medical, financial, aesthetic, or other reasons, should want to stop the use of tobacco in any form. To lessen the symptoms of deprivation he made use of lobelia or Indian tobacco, which closely resembles nicotine in its effects upon the nervous system. Of the five alkaloids contained in lobelia the chief is lobeline which, like nicotine, causes a brief stimulation of the motor centres in the spinal cord and medulla followed by depression and later paralysis. The symptoms of poisoning resemble those of nicotine poisoning—namely, nausea, giddiness, fainting, vomiting, and cold sweats. The first dose of lobeline sulphate, 1/8 grain, is given by mouth in capsule form immediately after the midday meal when the use of tobacco is abruptly stopped. The second dose is repeated whenever the patient feels the urge to smoke. It has not been necessary to use more than eighteen doses in twenty-four hours and often three or four are sufficient. A week of gradually lessening use of lobeline has been sufficient in most cases. After the first dose of lobeline the desire to smoke becomes less and less insistent. For a day or two there may be nausea, a metallic taste and a feeling of malaise but no other symptoms. In the great majority of Dorsey's cases there was no comparison between the uneasiness of stopping the tobacco habit without lobeline and when the drug was used as a buffer.

A STUDY OF THE TREND OF MORTALITY RATES IN URBAN COMMUNITIES OF ENGLAND AND WALES

WITH SPECIAL REFERENCE TO DEPRESSED AREAS

By

E. LEWIS-FANING, B.Sc.Econ

Of the Medical Research Council's Statistical Staff

(From the London School of Hygiene and Tropical Medicine
Division of Epidemiology and Vital Statistics)

In a report shortly to be published by the Ministry of Health the problem of the relation of the economic depression of 1928-33 to the death rate of the population of the depressed areas has been minutely examined. In view of the possibility of some delay in publication it has been suggested that a short summary of the investigation—indicating briefly the method of approach, the principal results, and the main evidence which forms the basis of the conclusions—might be of general interest. For detailed analysis the reader is referred to the complete report when published.

Mortality statistics derived from the publications of the General Register Office, whatever their limitations still remain the best index of the health of the general population we possess. They were therefore used in this study, the main object of which was to determine whether in the depressed areas the years of depression could be shown to have exerted a deleterious effect on the mortality experience demonstrable by establishing the existence either of a greater excess in their death rates over those of the country as a whole than was recorded in years previous to the depression or of a slower rate of decline since the depression began than has been apparent in other and more prosperous parts of the country.

Two methods of approach to the problem were adopted: comparison of (a) standardized death rates of all causes of death for the three triennial periods 1911-13, 1920-2, and 1930-2, and (b) of annual death rates in specific age groups from 1911 to 1934, with similar rates for certain towns in the country less severely affected by the depression and with the rates for England and Wales as a whole. The analysis of annual death rates was restricted to towns where no changes in boundary had occurred throughout the period.

My definition of the depressed areas is that generally adopted—namely for England the counties and county boroughs of Lancashire, Cheshire, Northumberland and Durham, and for South Wales the counties and county boroughs of Glamorgan, Monmouth, Brecknockshire and Carmarthenshire.

In making a selection of prosperous county boroughs I had recourse to a list of unemployment rates which calculated for other purposes from data provided by the Ministry of Labour related in all to sixty-eight county boroughs from all parts of the country depressed as well as prosperous. These unemployment rates were for the triennium 1927-9 and referred to males only. From this list I first excluded all north of Lincoln and also seaside and holiday resorts; from the remainder I selected those whose unemployment rate was below the mean of the sixty-eight boroughs. In addition I have included the administrative county of London.

Standardized Mortality Rates 1911-13 1920-2 1930-2

These rates are given for each of the northern counties and for the four Welsh counties as a whole in Table I. They show progressive decline in each successive triennium. Similar rates (omitted here) were calculated for every county borough within these areas and with but two exceptions (where the 1920-2 rate was the lowest) the same feature was apparent.

Rates calculated in precisely the same manner but relating to the prosperous group of towns are given in

Table II and in this group as in the depressed areas mortality has declined during the last two decades in every case examined. In each county borough for both sexes the standardized rates show a fall in 1920-2 and another fall in 1930-2. Thus absolute rates of mortality declined progressively from 1911-13 without serious check by reason of the economic depression.

TABLE I—All Causes Standardized Death Rates per 1000

	Males			Females		
	1911-13	1920-2	1930-2	1911-13	1920-2	1930-2

Ipswich	14.73	10.91	9.32	11.52	9.75	8.05
Leicester	15.42	13.67	11.23	12.67	11.23	8.83
Lincoln	14.55	13.17	10.33	11.99	9.52	8.74
Northampton	14.01	11.96	9.84	11.79	8.83	8.51
Norwich	14.32	11.91	9.67	11.76	9.69	7.88
Nottingham	16.69	14.16	12.55	14.09	11.64	9.32
Oxford	12.74	10.35	9.09	9.45	8.20	7.35
Reading	13.75	10.76	9.75	11.07	8.74	7.73
Worcester	14.15	12.40	11.30	11.77	9.40	8.65
London	16.30	14.11	11.71	12.76	11.02	8.71

But while in the depressed areas in only three out of thirty-two boroughs was the rate lower than that of England and Wales in any of the three periods examined in the prosperous group only three out of seventeen show mortality higher than that of England and Wales for both sexes at each of the triennial periods and even in these the amount of excess is slight compared with that experienced by the boroughs in the depressed districts. This is seen by reference to Tables III and IV in which the rates for every county and county borough examined are expressed as percentages of the rate for England and Wales.

From Table III it is also seen that in only two (Lancashire and Durham) out of the five geographical counties can the death rate in 1930-2 be said to have been approximately 20 per cent higher than that of the whole country. The three remaining depressed districts show much less excess. Furthermore Lancashire and Cheshire were both in a better position relative to England and Wales in 1930-2 than they were in 1911-13. If the country as a whole has improved from the point of mortality as we know it has these two counties have improved to a still greater extent. In the other three districts the relative improvement has not quite kept level with that in England and Wales since in each there was 2 or 3 per cent more excess in 1930-2 than existed in 1911-13.

Thus whilst it is true that the depressed areas have death rates in excess of England and Wales it is not true

that this excess is a consequence of the post-war depression of 1928-33. On the contrary it appears that these counties have in the last twenty years kept pace with the country as a whole as regards the decline in general mortality. The excess has been in existence for at least the last twenty years and has been nearly constant.

* Administrative county together with associated county boroughs.

† Geographical counties of Brecknock, Carmarthen, Glamorgan, and Monmouth.

Transferring attention from the counties as a whole to individual county boroughs, it may be briefly mentioned here that the exceptionally favourable position of Blackpool, Southport and Wallasey is shown in the report to be due mainly to the fact that they are better-class residential areas than other boroughs in the depressed areas. Omitting these therefore it is found that out of the remaining twenty-nine boroughs there was greater excess male mortality in 1930-2 than in 1911-13 in ten cases and of female mortality in ten cases also. But the excess of mortality in 1930-2 was greater than that of 1920-2 in only seven cases as regards either male or female mortality.

Even among the prosperous county boroughs of the South places can also be found whose position relative to England and Wales with regard to mortality has worsened (see Table IV).

Generally it may be said that in 1911-13 the boroughs of Lancashire had the highest male mortality which was 44 per cent in excess in Liverpool and Wigan. The tendency appears to have been for Lancashire to improve relatively its place being taken by Durham. The highest male mortality in 1930-2 is found in South Shields, bracketed with Salford with 38 per cent excess.

As regards female mortality, the most noteworthy point is the case of Merthyr Tydfil with 26 per cent excess in 1911-13, 28 per cent in 1920-2, but increased to 45 per cent excess in 1930-2. Detailed analysis of this increase shows it to be due to increase in tuberculosis of the respiratory system and of 'other tuberculosis, to an increase in heart disease at ages 5 to 24 (particularly at ages 15 to 24) and to an epidemic of diphtheria which in 1929-30 caused an increase in deaths of children between ages 5 and 14. I give evidence in my complete report in favour of the view that the increase in the rate of mortality from tuberculosis among females in Merthyr Tydfil is due to emigration of healthy young adult females between ages 15 and 24, with the result that on the average the weaker lives are left behind and the death rate increases.

Annual Death Rates in Age Groups, 1911-34

The analysis in this section was limited to the following groups of county boroughs these having experienced no changes in boundary during the period examined.

Northern Group (Depressed Areas)		Southern Group (Prosperous Areas)	
Bolton	} Principally textile	Gloucester	} Gloucester Leicester Norwich Nottingham Ipswich London (Administrative County)
Oldham			
Salford			
Wigan			
Bootle	} Shipping and heavy industries		
Newcastle			
Tynemouth			
West Hartlepool			
Merthyr Tydfil	} Coal mining and steel smelting		
Newport			

Annual death rates from all causes of death, in ages 0-4 5-14 15-24 25-44 45-64 and over 65 were calculated for each of these groups for the years 1911-34 and compared with similar rates for England and Wales. It was evident that the only satisfactory means by which the salient points of such a mass of data could be made apparent was graphical representation on logarithmic scales. For the purpose of this article it must suffice to

note the principal deductions which were made from the diagrammatic comparison

Over the period 1911-34 the general rate of mortality in England and Wales steadily declined the fall being greatest at ages 0-4. At age group 5-14 the fall was not so great, at 15-24 it was very slight indeed and at 25-44 somewhat faster again. At ages 45-64 a sudden fall occurred during the war years, the rates for some years before the war and since the war being roughly stationary. At ages over 65 the same phenomenon occurs, but the difference between the pre-war level and the post-war level is very much less in the older age groups.

With the exception of the Welsh group the graphs show that both in the depressed and in the prosperous areas the trend of mortality has been one of decline in proportion to the relation which each group bore to England and Wales in the years immediately preceding the war. The amount of excess or deficiency in mortality varies between the groups but is roughly constant for each group throughout the period. South Wales is differentiated in

at both 1911-13 and 1920-2 falling to 22 per cent in 1930-2 whilst for females the figures are 24, 22 and 21 per cent in excess. With the exception of age group 15-44 it will be noted that the percentage for both males and females was slightly lower in 1930-2 than it was in 1911-13. The death rate in the depressed areas has fallen at a slightly slower rate at these ages than that of England and Wales as a whole. In the former the rates of 1930-2 were 77 and 78 per cent of the 1911-13 figures for males and females respectively in the country as a whole they were 75 and 77 per cent. It follows that the very slight deterioration in the relative position at these ages is due to a somewhat smaller fall in the rate of mortality in the depressed areas than occurred in England and Wales as a whole. This is the sole piece of evidence I can find in support of the view that there was a worsening of the position of the depressed areas in the years of the depression.

The greater excess mortality at the adult ages among females than among males is yet another phenomenon

TABLE V—Showing the Death Rates in Age Groups in the Depressed Areas expressed as a percentage of the Death Rates of England and Wales

Age Group	1911-13			1920-2			1930-2		
	Death Rate in Depressed Areas per 1000	Death Rate in England and Wales per 1000	Percentage of England and Wales	Death Rate in Depressed Areas per 1000	Death Rate in England and Wales per 1000	Percentage of England and Wales	Death Rate in Depressed Areas per 1000	Death Rate in England and Wales per 1000	Percentage of England and Wales
Males									
0-14	19.81	16.12	123	14.82	12.08	123	9.81	8.05	122
15-44	5.72	5.16	111	5.24	4.69	112	4.40	3.85	114
45-64	24.56	21.04	117	19.48	16.98	115	18.35	16.51	111

Females									
0-14	16.95	13.67	124	12.11	9.92	122	7.87	6.49	121
15-44	5.00	4.32	116	4.59	3.98	115	3.90	3.33	117
45-64	19.64	16.16	122	15.22	12.89	118	13.75	11.97	115
65	84.38	76.23	111	77.77	69.66	112	74.65	65.39	107
All Ages	14.48	13.16	110	12.39	11.60	107	11.74	11.24	104

that its mortality which was but little in excess of the average before the war increased in most age groups and remained stationary in others. Particularly is this true of female mortality. Thus the trend of mortality there has been upward and its position relative to England and Wales decidedly worse at the end of the period.

In the textile and heavy industry groups in the depressed areas excess mortality prevailed for both sexes at every age group throughout the period but in South Wales only since the war. In the prosperous towns mortality has been roughly at the level of England and Wales as a whole. London can be classed with the prosperous group except at ages 25-44 and 45-64 where male mortality is found to have been consistently in excess of the general level.

Finally I combined all the counties and county boroughs of the depressed areas and calculated death rates in broad age groups for this aggregate depressed area for the three triennial periods 1911-13, 1920-2 and 1930-2, and compared the rates so found with the rates of England and Wales in the same age groups and for the same periods. The figures are given in Table V.

Broadly speaking the figures for 1930-2 show that in those years the excess mortality was greatest at the youngest age group and also that among adult females the excess was greater than among males. But when attention is turned to the earlier triennia it becomes clear that the excess mortality in 1920-2 cannot be associated with the economic depression of that time. The two earlier periods show precisely the same type of relationship. At ages 0-14 the mortality of males in the depressed areas was 23 per cent above the rates of England and Wales

which though present in the depressed period, is found to have occurred at 1920-2 and 1911-13 and presumably has been present consistently throughout the period.

These results it would seem must lead to the conclusion that there is no evidence from the trend of mortality rates from all causes of death that the health of the population of the distressed areas has been unfavourably affected by the economic depression. Excessive mortality, these areas certainly have but this excess is not peculiar to the years of the depression. It has been a consistent feature of their mortality experience for at least the past twenty years.

Whilst on the one hand we may be inclined to regard this as a matter for congratulation let us not overlook the fact that my analysis shows that we are concerned with a more deeply rooted evil possibly involving genuine geographical and racial factors. The existence of evil conditions is not mitigated by reason of their having always been evil.

The preliminary programme of the Health Congress to be held at Birmingham from July 12 to 17 by the Royal Sanitary Institute has now been issued. The list of subjects to be discussed includes the development of the maternity service, care of the pre-school child, physical education, incapacitating sickness, health education, housing progress and prospects, safeguarding of bill mill, and the value of medical services to industry. Lord Dudley is president of the congress and the Minister of Health will address a general session.

WHAT IS OSTEOPATHY?

A FRANK ANALYSIS

Dr Charles Hill and Dr H A Clegg ask, in the title of their book, 'What is Osteopathy?' but after an entertaining and informative analysis really find themselves unable to answer the question. Indeed it cannot be answered. Sincere osteopaths, like sincere homocopaths, find themselves in the thrall of a declaration of faith delivered once for all. Though they realize that in science the old shibboleths have constantly to be revised in the light of new discoveries they feel, if they utter heresies against the creed of Still or of Hahnemann, as a Jesuit would on renouncing the vows of his order. They carry religious fervour into the cool atmosphere of science with the result that the outsider reading their writings finds himself in a world compared with which Cloud Cuckoo Land or the land Through the Looking-glass seems solid ground indeed. Still believed in such things as a 'poisonous gas' theory of infectious disease, in spontaneous generation in honey for diabetes, and in treating meningitis by half-pint doses of whisky. Since the prime tenet of the faith is that the body contains everything necessary to its own cure why the whisky? He said 'No system of allopathy, with its fatal drugs, should ever be permitted to enter our doors. When other methods are brought in just that much of osteopathy must move out.' Yale Castilo says 'It has never been found necessary to retract in the slightest degree from [this] original creed.' Yet he describes antiseptics, anaesthetics, stimulants, sedatives, anodynes, cathartics and narcotics as 'useful or indispensable.' E J Conley, writing in 1935, said that Still 'never expected his followers to prostitute his discovery by making it a tail to any other therapeutic project.' Yet Dr Kelman Macdonald, who may be regarded as the most distinguished and reasonable of British osteopaths, admits that he would recommend insulin, adrenaline, parathormone and liver extract, though 'our views are all at complete variance with those of the medical school.' He discards Still's teaching of the displaced bone as a 'delightfully simple but utterly erroneous hypothesis,' but he believes that typhoid fever only attacks the osteopathically unsound while admitting that we have no evidence whatever for that belief. It must be difficult to try to be a modernist and a fundamentalist at the same time.

Mr Streeter says that the osteopathic lesion is a name given to any structural derangement, no matter how small or where found in the body in that case why osteopathic? Our authors summarize the various views which have been expressed as to the nature of the lesion thus. It has in its time played many parts, a dislocated hip, a twisted rib, a dislocated spine, a contracted muscle, a fixed joint, a strained joint. It presses and it does not press. It is swollen and it is contracted. It can be demonstrated by x rays and it cannot be so demonstrated. It has been seen post mortem, and it has not been seen post mortem.

So long as the theory of osteopathy remained a faith it was secure. But when challenged it appealed to the Caesar of the experimental method—and with disastrous results. It is always dangerous to start on research with preconceived notions as to what is going to be found. It is still more dangerous when the observer does not know the difference between the anterior and posterior horns of the spinal cord (p 94) describes non-existent lateral ligaments of the spine (p 104) and a thirteenth thoracic vertebra (p 109) thinks that carbonates exist as such in the blood and that carbon dioxide is an important factor in increasing the alkalinity of the blood (p 96). I have

read the *Bulletins* of the A T Still Research Institute, and agree with Drs Hill and Clegg that 'if any medical man carried out research in such a way he would find it impossible to get his results published in a decent medical journal.' Nay more he would quite rightly be refused a licence by the Home Office for carrying out such experiments on animals. Partial dislocations of the spine leading to severe surgical shock were produced without an anaesthetic. It is interesting to note that osteopathic treatment was of no avail in restoring the animal to health. This does not afford much support for osteopathy as a treatment for a demonstrable osteopathic lesion!

A reading of these *Bulletins* reminds one of the passage in Anatole France's *Penguin Island* in which he burlesques the Dreyfus trial. As it had been objected that there were no proofs, literally cartloads of documents poured into the War Office. The Minister for War shook his head.

We were safe as long as there were no proofs. He knew that proofs such as these condemned themselves.

It may well be asked if the theory of osteopathy rests on such unsound foundations how can its practical successes be explained. That is not difficult. Some of Sydenham's theories were fantastic, but his clinical observations were sound. In the past absurd explanations have been given of the mode of action of drugs which had been empirically proved to do good. But we have no subconscious sense of guilt in accepting the observations while discarding the explanations, since we are bound by no creed except the search for truth. Osteopathic manipulation may certainly do good in some conditions, where (as Wharton Hood put it) muscles, tendons or even articular extremities are tied down. And it cannot be denied that the medical profession, influenced perhaps by Hilton's classic *Rest and Pain* were unduly slow to recognize that fact. Secondly, a successful osteopath is often a shrewd judge of character. I knew a lady who derived great benefit from an osteopath because while he pummelled her back vigorously he poured out a stream of home truths from which she could not escape. Each session ended in tears and protests that she had been insulted. But she continued the treatment!

This book can be cordially recommended to all who wish to know the facts about osteopathy, clearly stated and well documented. The authors' conclusion is that if the osteopath restricted his therapeutic claims [to manipulative surgery] and did not attempt to erect a new theory of health and disease on an imaginary pathology and unproved hypotheses, the medical profession would have no excuse for not listening to him. But they point out the necessity for accurate diagnosis in order to avoid the disasters resulting from manipulation, say, of a tuberculous knee or of the spine for cancer of the breast. As to the training necessary to avoid such disasters the conclusion of the Select Committee of the House of Lords may be quoted. The claim of the osteopaths to treat all diseases has not been established and it would not be safe or proper for Parliament to recognize osteopathic practitioners as qualified to diagnose and treat all human complaints. The only existing establishment in this country for the education and examination of osteopaths was exposed in the course of evidence before us as being of negligible importance, inefficient for its purpose, and above all in thoroughly dishonest hands. So an appeal to another kind of Caesar met with no better fate.

Mr H G Wells contributes a preface in which he sums up the whole position with characteristic directness and lucidity. While recommending the medical profession to adopt as speedily as possible whatever good there is in manipulative healing he says: 'There can be little doubt that the creation of such an alternative school of healing, duly recognized and incorporated would flavour the general discussion of health with much obscure intisim, sectarianism and bitterness.'

CALCIUM REQUIREMENTS IN MAN

It is so often suggested in nutrition surveys that calcium intakes are below the optimum that a recent review of the calcium requirements of man by Dr I Leitch of the Imperial Bureau of Animal Nutrition¹ is of great interest. He calculates that the maintenance requirement of adults is 0.55 gramme daily. Sherman, whose figures have been very generally used in the past, put the equivalent figure at 0.45 gramme. Both these figures are maintenance requirements and exclude the additional health allowance which is advisable. It has been shown by Sherman in America and Orr in this country that many diets do not even reach the figure of 0.45 gramme. Leitch enters into some interesting speculations as to the possibility of senile osteoporosis being due to deficient calcium intake. In his estimates of the requirements at different age periods the most striking feature is the high requirement in adolescence increasing up to 2 grammes between the years 15 and 16. Assuming that milk provides two thirds of the calcium intake, this means that children at the age of 16 need two pints of milk a day.

An interesting section is devoted to the calcium supplied to the infant in breast milk. Leitch brings forward evidence that breast milk is often qualitatively and quantitatively inadequate as a source of calcium for the infant. Qualitatively in the figures he quotes from various authorities there is a range from a minimum of 0.126 to a maximum of 0.717 gramme per litre of breast milk. On the quantitative side numerous experiments are quoted which indicate that the supply of breast milk is often inadequate. More important is the suggestion that there may be a disparity between calorie value and calcium content of breast milk. If this is true, then growth may be occurring in the infant without the calcium needs being properly met. Taking the optimum growth curves for infants Leitch calculates that in order to maintain the optimum 10 grammes of calcium per kilogramme of body weight which is found at birth the calcium intake must be 0.2 gramme at 1 month and 0.52 gramme

at 6 months. This corresponds in breast milk of average calcium content (0.32 gramme per litre) to a daily intake of 30½ fluid ounces at 1 month and 57 fluid ounces at 6 months. There are many nursing mothers who do not reach this yield, and if the calcium content is much lowered the possibility of deficiency arises. There are at least two assumptions in this reasoning that might be challenged. The first is the assumption that it is physiological for the birth ratio of calcium to body weight to be maintained. Too little is known about changes in the ratio of bone weight to body weight in the first few months of life. The second assumption on which the calculations have been made is that 60 per cent of the ingested calcium is retained by the body. We are confronted again by the paucity of knowledge of the processes of absorption from the intestine. It is obvious that the subject of the calcium intake of infants requires careful examination. The most urgent need is to know whether the calcium content of breast milk can be affected by the mother's diet. Cow's milk contains nearly four times as much calcium as breast milk, but until there is more information about the fate of the calcium in the intestine it cannot be deduced that cow's milk is a better source of calcium for the infant. The review deals with some of the points raised in this connexion. Cow's milk usually has to be diluted before being given to infants, but more important is the fact that the buffering power of cow's milk is much greater than that of breast milk. Since it is likely that the absorption of calcium depends on the pH of the intestine the ability of the infant to absorb the calcium of cow's milk will depend to a certain extent on its power to secrete gastric hydrochloric acid. Existing knowledge of the secretion of hydrochloric acid in children points to marked variations. To a certain extent the high buffering power of cow's milk can be reduced by treating the milk with acid. Further, it seems more than likely that one of the functions of vitamin D is to lower the pH of the intestinal contents and hence increase the absorption of calcium.

Dr Leitch's review suggests many possibilities in relation to stature and its dependence on diet. Certainly all nutrition workers in England and America are agreed about the ever-present danger of calcium deficiency in modern diets, and as the reviewer points out there is need for much more research work on the subject.

¹ *Nutr. Abstr. Rev.* 1937, 6, 553

THE DEFENCE BUDGET

Mr Neville Chamberlain's sixth Budget is of more than ordinary interest not only because it is apparently his last, but because it sets up a new source of revenue which it is hoped will go a long way towards solving the financial problem created by the special defence expenditure of the next few years. Not that the new levy is likely to provide more than a comparatively small part of the money necessary, the greater portion will have to be borrowed, but it will facilitate that borrowing by establishing the soundness of the nation's financial system and helping to provide for payment of interest on the money borrowed. In spite of the unexpected falling off in receipts from income tax and surtax the past year was very satisfactory and (apart from debt reduction) showed an excess of ordinary receipts over ordinary expenditure of £7,500,000. Taking the revenue for the present year on the basis of existing taxation the increase in expenditure would create a deficit of nearly £15,000,000, and the Chancellor's primary task was to fill that gap.

In accordance with general expectation the income tax is to be raised to 5s in the £ and the increase of 3d in the £, coupled with additional revenue to be anticipated from levying the tax on the higher profits of 1936 instead of on those of 1935 and from taking steps to reduce artificial avoidance of the tax is expected to produce an additional £13,000,000. The balance of £2,000,000 could no doubt be raised by modification of existing taxes such as the petrol duty or the tobacco tax or from some of the new sources of revenue which Mr Chamberlain had considered—such as the suggested tax on cosmetics. He has however taken a more far-sighted and as many will think, a more statesmanlike view of the situation. The new defence levy which he has explained in outline is obviously derived from the excess profits duty which was so prominent a feature of the national finance during the great war. It must be admitted that apart from the outstanding difference that happily we are not actually at war the circumstances are in many respects similar. Now as then enormous Government expenditure is tending to the enrichment of some but to the impoverishment of the community as a whole and the reaction of any one industry on others is such as to render hopeless any attempt to disentangle from the general result such elements of increased prosperity as are due to that expenditure. The conclusion is irresistible that in such circumstances those who are fortunate enough to participate in the special

prosperity should contribute specially out of their increased gains. There is not space here to discuss the form the defence levy is to take, it will suffice to say it is clear that the Chancellor's advisers have followed the main lines of the old excess profits duty but have endeavoured to introduce such modifications as will remove some of the worst features of that much disliked but very prolific tax. We are glad to note that it is not proposed to extend it to employments or to professions. Such an extension would be unlikely to produce much revenue—for it is in the world of industry and trade that increasing demand and rising prices create extra profits—but it would undoubtedly cause inconvenience and expense in connexion with the various returns and computations that would be necessary. The Chancellor does not anticipate from this source in the current financial year more than the £2,000,000 necessary to balance his account, but for the following year it is estimated to produce over £20,000,000.

The increase in the income tax will make an appreciable addition to the already heavy burden borne by the professional man but after the rumours that have appeared in the Press or have passed from mouth to mouth in the past few weeks he can at least feel that he has escaped other calamities. The petrol duty is not increased the surtax limit is not lowered to £1,500 and not less but nearly £4,000,000 more is to be spent on roads. Mr Neville Chamberlain has again brought to the management of the national finances those qualities of foresight and business acumen which the public have learned to associate with his previous Budgets. He has not only solved the immediate problem in a sound and equitable manner he has laid the foundation for the finances of the next few years and his successor should have good cause for gratitude.

CONTROL OF FOOD HANDLERS

Complete knowledge of the amount of illness caused by people who deal with food—food handlers—in the American sense—must obviously be lacking. Epidemics of scarlet fever, typhoid and paratyphoid fevers and epidemic sore throat in recent years in England must have convinced people of the dangers of this source of infection and a perusal of the rich store of facts compiled by J. C. G. Ledingham and J. A. Arkwright vividly brings home the fact that the carrier is a danger to the food handling trade. The Americans take these matters more seriously and logically and the supervision of food handlers is enforced by comprehensive regulations in the U.S.A. A recent report gives rise to the speculation that some greater measure of control in

England might be advisable although typhoid for example is not the common danger here that it is abroad—the result of the pioneer and progressive work on sewage and water supply which England gave to the world. Dr J R Scott¹ of Albuquerque New Mexico records the results of ten years' examination of specimens—presumably faeces—from food-handlers. Among 6 600 specimens examined twenty from twenty individual food handlers gave cultures of typhoid bacilli; the positive carriers derived from various occupations being 3 per 1 000 among milk producers and among restaurant staffs and four among 700 bakers. It may be that our English system of general supervision and intense "detective work" by efficient bacteriologists when an outbreak occurs is in the long run more effective and less costly than the American system, but is it? Such a system might be described as 'delayed preventive medicine' and delay may entail loss of life.

HISTAMINE AND ANAPHYLACTIC SHOCK

The association of histamine or histamine-like substances with various conditions of shock and anaphylaxis has for long been the object of experiment. Several investigators have observed the liberation of histamine-like substances during anaphylactic shock using the isolated lungs of "shocked" guinea-pigs. Recently the matter has been reinvestigated by H Schild, who considers that the available evidence is strong enough at least to warrant the working hypothesis that it is indeed histamine which is liberated in the guinea-pig's lung during anaphylactic shock. Schild also used the isolated perfused lungs of guinea-pigs previously sensitized actively or passively with egg albumen or with serum from rabbits previously sensitized to egg albumen. The shock condition was induced in the perfused lungs by introducing 10 mg albumen into the perfusing fluid. The presence of histamine-like substances was tested for in the perfusate by the usual pharmacological methods using histamine acid phosphate as comparison. By inducing shock at different intervals from the time of sensitization it is possible to obtain more or less graded responses in bronchoconstriction and vasoconstriction in the lung. Thus any correspondence between the degree of shock phenomena and the liberation of histamine could be observed. Schild discovered a close relation between the bronchial and the vascular reaction and the amount of histamine detectable in the perfusate. Histamine does not, however, seem to be the only agent concerned in the phenomena of shock, since the amount of histamine detectable is many times smaller (probably 1/100) than that necessary to reproduce the intense effects of anaphylactic shock. As it could be shown that the bronchoconstriction brought about in the lung preparation by addition of barium chloride to the perfusing fluid does not lead to a liberation of histamine, it can be concluded that "shock histamine" is not a result of the muscular contraction in the bronchi and the vessels. This is an important finding, because it was

conceivable that the known changes in permeability in the muscle cells during shock might lead to a liberation of intracellular histamine. As many agents can cause shock symptoms in non-sensitized guinea-pigs (1 molin agar, inorganic potassium and calcium salts, distilled water, etc.) it was important to demonstrate as Schild did that such "anaphylactoid" reactions do not release histamine from the isolated lungs. Distilled water was an exception to this, but Schild attributes this to a disintegration of the cells rather than to an active response of the tissue. It is well known that adrenaline inhibits the bronchoconstriction of anaphylactic shock, and it was found that this was so in the 'shocked' isolated lung and also that adrenaline decreased the vasoconstriction. Investigation of these effects of adrenaline revealed that there was a parallel diminution in the liberation of "shock histamine" when the inhibition was marked, thus confirming the close correlation of histamine and smooth-muscle contraction. It would appear too that if histamine is not the only substance associated with the smooth muscle contractions, adrenaline also inhibits the liberation of the unknown others. It is clear that the solution of the problem of anaphylaxis is still remote, but the method of the perfused lung seems to offer a rich field.

SKIN DISINFECTION

It is remarkable that there should be no general agreement on the best method of disinfecting normal skin. If the truth were known the method might be found to vary with circumstances, but some of the innumerable reagents or combinations of reagents now in use could certainly be abolished if only for the sake of simplicity. Unfortunately there is no generally recognized method of testing a skin disinfectant, although many have been suggested and used. Dr Jørgen Ernst in his recent monograph¹ describes an extensive series of tests of this nature, in which the method of cultivation was rubbing the skin of the hand and forearm with a gauze swab which was then shaken in a measured volume of sterile saline from which 1 c.c. was then sown as a shake culture in blood glucose-agar. Such tests were carried out daily for a month on physicians and nurses in a maternity hospital who employed a specified method of disinfection throughout this period. The object of this long continued repetition was to discover whether repeated chemical treatment of the skin abolished its natural power of self-disinfection and whether it led to a persistent decrease or increase in the bacterial population of the skin. The flora involved was only that of the normal skin, no extraneous bacteria being applied; this difference from Colebrook's technique perhaps accounts for the fact that the conclusions reached are diametrically opposed to his. Ernst found 0.1 per cent mercury perchloride the most effective of his reagents and dettol cream useless. Killing extraneous and possibly dangerous bacteria on the surface of the skin is both more impor-

¹ Canadian Pub. Hlth. J. 1937, 28, No. 1, 42.

² Quart. J. Physiol. 1936, 28, 165.

Hautdesinfektions Probleme By Jørgen Ernst, Copenhagen, Levin and Munksgaard, 1937. (10 Cms.)

tant and an easier matter than getting rid of saprophytic staphylococci which live not on but actually in its superficial layers indeed "scrubbing-up" even increases the recoverable number of such comparatively harmless bacteria. This is a distinction which Dr Ernst himself does not seem fully to appreciate. Nevertheless the apparent incompatibility of his results with those obtained by others indicates clearly enough that the last word has yet to be said in this difficult field of study. Other disinfectants tested were spirit and alcohol in various forms and iodine unfortunately there were no tests of ether organic mercury compounds, picric acid flavine or other dyes these would have afforded an interesting comparison. A factor which had to be considered was the skin's tolerance of chemical treatment. Whatever roughness was produced either in this way or by such harmless pursuits as tennis playing the bacterial counts rose as of course they did when there was any sort of skin lesion. The figures in the tables of results are somewhat more erratic even than those need be which are obtained by a quantitatively imperfect method and it is unfortunate that they are not averaged for the sake of closer comparison. Nevertheless this is a careful and interesting study.

LONDON'S MENTAL HOSPITAL SERVICE

The London County Council looks after a population of mentally afflicted persons—including only those under institutional care—equal to the total population of towns of the size of Aldershot Macclesfield or Gravesend—namely about 34 000. The twenty institutions in which the mentally disordered or the mentally deficient are housed occupy more than 3 000 acres and employ a staff of nearly 9 000. The annual report of the Council on this subject¹ is almost entirely statistical, but from the figures much interesting information can be gathered and many speculations may start. For example among the certified patients of all ages in mental hospitals the single are in excess of the married but among the voluntary and temporary patients from middle age onwards the married are in excess of the single. Among certified single patients the males exceed the females down to and including the age period 35–44 but afterwards the females exceed the males eventually doubling them in number while among married patients the females are in excess at all ages. During 1935—the year with which mainly the report deals—of the 3 356 cases admitted directly to mental hospitals over 71 per cent were 'first attacks. The most frequent cause was prolonged mental stress' and the next was acquired syphilis. The commonest form of mental disorder among the new admissions was recent (that is under one year) melancholia with non-systematized delusional insanity second on the list. As to the occupations of those admitted in a list of thirty classes the one described as 'housewives retired persons children scholars and students' accounted for twice as many as any other.

The number discharged recovered was 1 046 the ten year age period showing the largest number of recoveries was 35–44 for females and 45–54 for males. Of the 41 000 patients discharged 'recovered' during the last forty years 13 000 were readmitted to a London mental hospital, 4 500 of them within twelve months of their discharge. Of the 1 194 patients who died in mental hospitals in 1935 the greatest number were of the age period 55–64 but this was very closely followed by the number for the period 65–74 and 163 of the total number lived to 75 or over. Tables are given relating to the special work of the Maudsley Hospital with its out-patient department and the three out-patient psychiatric clinics attached to general hospitals. The number of patients disposed of during the year in these four out-patient clinics was 2 775 while 469 were admitted from the clinics to the wards of Maudsley. The average daily number of patients on parole in mental hospital grounds was 10.66 per cent of the total number of certified patients while 2.28 per cent were allowed outside the hospital grounds and 12.05 per cent had short periods of leave. The new cases of mental deficiency with which the Council was called upon to deal during the year numbered 774. The total number of defectives living of whom the Council has records is 16 378. 10 361 of these are under active care under the Acts while the remainder have already been under care. This figure which excludes the 3 752 children attending special schools for the mentally defective gives a ratio of 3.91 of the population of the county. Finally there is a brief appendix by Dr F. L. Golla pathologist to the mental hospitals in which he touches on the routine investigations and the special researches. The latter as he mentions them one by one seem very numerous but he adds the comment that the work (of research) continues to be patchy in its distribution and 'in certain institutions there is a spirit of inquiry among the medical staff that is lacking in others with equally good facilities for investigation'.

THE SEVEN STAGES OF JOHN BLAND SUTTON

Sir Comyns Berkeley contributes an interesting account of his friend and colleague the late Sir John Bland Sutton to the *Journal of Obstetrics and Gynaecology of the British Empire*¹. Entitled "The Seven Stages of John Bland Sutton and an Epilogue" it has as a frontispiece George Belcher's portrait from *Punch* with the old Middlesex Hospital in the background. Sir Comyns traces the history of Bland Sutton from his schooldays when lack of peace nearly led him to become a school master in an elementary school through the period when he lived by coaching perverse and idle medical students at Cooke's School of Anatomy until he had saved the £100 which he paid in golden sovereigns to the dean of the Medical School at the Middlesex Hospital in exchange for a perpetual student's ticket. And says Sir Comyns the dean had a hole in his pocket so that some of the hard earned coins never reached the bank for they literally fell out on the way. Plodding industry

² Supplement to the *Journal of Obstetrics and Gynaecology of the British Empire*, April, 1937. Sherratt and Horley, The Surt and Sons, Pres., Limerick, Chelsea.

and skill in teaching led Bland Sutton slowly up the ladder to success until as he used to say himself he discovered a gold mine in the bellies of women and exploited it. He then turned his attention to public work for the profession and did it well as he had done everything else well lecturing at the Royal College of Surgeons serving on its Council and finally attaining the acme of his ambition when he was elected President. He rose slowly but not without friction jealousy and personal feelings often obstructed his progress but never made him bitter and his many hobbies enabled him to make light of them. His love for and curiosity about every kind of animal and the constant urge to travel were a godsend and enabled him to reach a happy old age for he was more than 81 when he died. It was right that his memorial service should be held in Westminster Abbey for apart from his professional eminence he was a Londoner of Londoners and his speech ever bewrayed him.

ACTION OF ACETYLCHOLINE ON SKELETAL MUSCLE

The theory that nerve impulses are transmitted in the autonomic nervous system by chemical intermediaries is now widely known and accepted as a result of the work of Loewi, Dale and their colleagues. Dale, Feldberg and Vogt¹ developed this general conception further and presented evidence that acetylcholine is liberated by nervous impulses at the endings of motor nerves to skeletal muscle. They naturally suspected that the acetylcholine so liberated might act as the normal transmitter of excitation from the nerve endings to the muscle end plate. To strengthen the evidence in support of such a view it was necessary to show that injected acetylcholine could cause a quick contraction of skeletal muscle resembling that produced by normal stimulation of a motor nerve. Dale and Gasser² had previously demonstrated that acetylcholine injected intra-arterially gave rise to a contraction of denervated skeletal muscle (which had been deprived of its motor nerve supply by appropriate section some weeks earlier). The Simonarts³ were apparently the first to prove that large doses of acetylcholine could cause a contraction of normally innervated skeletal muscle though the responses obtained were weak and irregular. Brown, Dale and Feldberg⁴ have advanced the subject further by showing that acetylcholine when injected rapidly enough into the empty arteries of normal mammalian muscle (the method of "close range injection") in doses as small as 0.002 mg produces with absolute regularity a contraction equal to or exceeding that resulting from a single maximal shock applied to the motor nerve. The muscle response to acetylcholine is abolished by previous treatment with curari as is the response to stimulation of a motor nerve but it is unaffected by atropine. After small doses of eserine a single shock applied to the motor nerve produces not a simple twitch

as is normally the case but a repetitive response resembling an evanescent tetanus. This result is compatible with the view that eserine by exerting its well known action of inhibiting the esterase which normally destroys acetylcholine permits the acetylcholine liberated at the motor nerve endings to persist longer and so gives rise to a series of responses on the part of the muscle. Bacq and Brown⁵ have further demonstrated that other members of the eserine series increase (potentiate) the response to stimulation of a motor nerve to a degree which is proportional to their ability to inhibit the action of cholinesterase *in vitro*. Recent studies by Brown⁶ show that acetylcholine sets up electrical changes in the muscle of a repetitive character like those occurring during normal activity. He examined the reactions of single muscle fibres after the injection of acetylcholine and found that the action currents were first of a high frequency and then gradually tail off; this would be in agreement with the view that acetylcholine acts as a stimulus in proportion to its concentration. But as Eccles has suggested in a recent review a number of points still remain obscure and will need clearing up before the acetylcholine theory of transmission at motor nerve endings can be completely accepted. It is for instance known that eserine in suitable doses may cause not potentiation but a depression of the response to motor nerve stimulation particularly if it is repetitive at frequencies over six per minute. Again after the administration of eserine acetylcholine may depress the response of the muscle to subsequent stimulation of a motor nerve. Dale has suggested in explanation of these findings that under certain conditions the persistence of acetylcholine in the vicinity of the muscle fibres may interfere with their normal reactivity. It must be borne in mind, however that whatever may be the ultimate fate of the acetylcholine theory (and the evidence as a whole in its favour is very strong) it has already led to practical results of great value in clinical medicine in suggesting the prostigmine treatment of myasthenia gravis which has proved so helpful in the management of patients suffering from this disease.

Dr R. A. Young will deliver the annual oration before the Medical Society of London at 11 Chandos Street, Cavendish Square on Monday, May 10 at 8.30 p.m. His subject is "Perspective and Poise in Practice."

The *Canadian Medical Association Journal* announces that the conjoint sessions of the Canadian Medical Journal and the Ontario Medical Association to be held in Ottawa during the week beginning June 21 will be graced by the presence of their Patron-in-chief the Governor-General. Lord Tweedsmuir will attend as guest of honour the luncheon on June 23 and participate in the ceremonial function on the evening of the same day.

ENDOCRINES IN THEORY AND PRACTICE

This article is one of a series on Endocrinology, contributed by invitation

THYMUS AND PINEAL GLANDS

BY

SAMSON WRIGHT, M.D., F.R.C.P.

Structure and Development of the Thymus

The thymus is made up of lobules bound together by connective tissue. Each lobule consists of a deeply staining outer cortex of closely packed lymphocytes and a more faintly staining central medulla containing a reticulum of large branched cells in the meshes of which are comparatively few lymphocytes. The medulla also contains the concentric corpuscles of Hassall, which consist of a hyaline centre surrounded by several layers of flattened cells with poorly staining nuclei. Developmentally the thymus is an ectodermal structure which later becomes invaded by numerous lymphocytes derived from the mesoderm.

It is uncertain whether any of the original epithelial elements of the thymus persist after birth and function as secreting cells. Hammar regards the Hassall corpuscles as epithelial cells that have undergone a peculiar form of differentiation. Some histologists attempt to distinguish between lymphocytes and so-called "thymic" cells but it is doubtful whether such a distinction is possible. According to most workers the thymus continues to enlarge in size until about the time of puberty, and usually reaches its greatest development between the ages of 14 and 16 years. It then becomes progressively smaller, and atrophies at 50 to 60 years of age. The statement commonly quoted that the thymus attains its maximum size at the age of 2 is almost certainly incorrect.

Effects of Thymectomy

The published reports of the results of extirpation of the thymus are conflicting, but on the whole the changes observed are small. In young animals nutritive changes, characterized mainly by adiposity, are said to occur. The skeleton is small and the bones are atrophic. Interesting experiments have recently been carried out to determine the effects of thymectomy in five successive generations of rats. Growth is definitely retarded in the second and later generations, especially in the first four or five weeks of life: thus a control rat at 18 days weighed 23 grammes and a thymectomized rat of the second generation at the same age weighed only 12.5 grammes.

It is important to stress that the thymus undergoes atrophy in any condition of malnutrition or prolonged illness and more especially perhaps in deficiency of vitamin B.

Enlargement of the Thymus

After castration in young animals the thymus remains large, and does not undergo its customary involution at puberty. It has been suggested on the basis of this observation that the normal decrease in the size of the thymus is due to an internal secretion formed by the gonads. In a number of clinical conditions the thymus fails to undergo involution at the proper time or possibly may show renewal of growth after involution has taken place. Such hyperplastic glands usually associated with general lymphoid overgrowth are sometimes found in infants. The abnormal thymus may weigh as much as

60 grammes at birth, and may constitute an obstruction to the respiratory passages or to the great veins.

A disorder called "thymic asthma" is described in older children; this is attributed to mechanical obstruction by an enlarged thymus, and is said to be relieved by partial removal of the gland. The thymus is enlarged in many cases of exophthalmic goitre, Addison's disease, acromegaly, eunuchoidism, and in a high proportion of cases of myasthenia gravis. Neither the mechanism of production of this enlargement nor its significance is at present understood.

The condition known as status thymo lymphaticus merits fuller consideration. In many young persons who have died suddenly after some slight injury or infection apparently insufficient to account adequately for the fatal result, general swelling of the lymphoid structures and enlargement of the thymus may be found at necropsy. It is commonly assumed that the hyperplasia of the thymus is related in a significant manner to the occurrence of sudden death. The whole subject needs further investigation. Recent studies suggest that general lymphoid overgrowth is not regularly associated with thymic enlargement in these cases, and that there is, therefore, no justification for the term 'status thymo lymphaticus'. Others assert that the thymic overgrowth is of no importance in itself and is only of interest as one manifestation of a general constitutional inferiority of the affected person. It is claimed that in these subjects the heart is weak and the large blood vessels relatively narrow and thin-walled. It may be that the failure of the inadequate circulatory mechanism is an important factor in causing death. The male subjects tend to show female secondary sex characters, such as scanty hair, smooth skin and small external genitals. In women the thorax and extremities are slender, the reproductive organs are poorly developed, and menstruation is irregular or absent. The incomplete development of the gonads which characterizes these cases may perhaps be responsible for the failure of the thymus to undergo its normal involution after puberty. It must again be stressed, however, that there is as yet no evidence that the state of the thymus is in any way directly responsible for the sudden death in these cases.

Action of Thymus Extracts

Earlier workers such as Asher, claimed that thymus extracts produce general skeletal growth and hasten the development of the gonads: the active principle was called thymoeresein. More convincing experiments have recently been carried out by Rowntree who injected thymic extracts into successive generations of young rats. The extracts were prepared by Hanson's method, which consists of making an extract of the neck thymus gland of calves with 0.5 per cent hydrochloric acid. The extract is a golden yellow liquid with a pH of about 5. It is non-toxic in relatively large doses and non-irritating locally when injected. 100 ccm of the extract correspond to 60 grammes of raw calf thymus.

The result in the first generation of treated rats was that the animals became heavier than the controls, bred more frequently and gave rise to larger litters which were above the average in weight. In the third to seventh generation there was increasingly precocious differentiation. In the data which follow quoted from Rowntree the normal

PRELIMINARY

ANNUAL MEETING, BELFAST, 1937

1 THE ANNUAL MEETING, 1937, commences at Belfast on Friday July 16th under the presidency of Professor R. J. Johnstone, F.R.C.S., F.C.O.G., Member of Northern Ireland Parliament.

ANNUAL MEETING, OXFORD, 1936

2 The Council has had pleasure in conveying the thanks of the Association to the President (Sir E. Farquhar Buzzard), the Honorary Local General Secretary (Dr F. G. Hobson), the Honorary Local Treasurer (Mr W. M. Goodenough) to the municipal and university authorities and to other official and private persons who contributed to the welfare of the members of the Association taking part in the Oxford meeting.

ANNUAL MEETING, PLYMOUTH 1938—ELECTION OF PRESIDENT, 1938-39

3 In connexion with the Annual Meeting to be held in Plymouth in 1938 the Plymouth Division has nominated Dr. Colin D. Lindsay as President of the Association, 1938-39.

The Council recommends

Recommendation That Colin D. Lindsay, M.D., Honorary Senior Physician, Prince of Wales's Hospital, Plymouth Physician Royal Eye Infirmary Plymouth and Consulting Physician Tavistock Hospital, be elected President of the Association, 1938-39.

Loyal Address to His Majesty The King

4 The Council has submitted the following Loyal Address to His Majesty the King, George VI, upon the occasion of His Accession to the Throne.

To the King's Most Excellent Majesty

The Humble Address of the President and Members of the British Medical Association

May it Please Your Majesty

We, Your Majesty's dutiful and loyal subjects, the members of the British Medical Association distributed throughout Your Majesty's Empire, humbly tender to Your Majesty congratulations upon Your Accession to the Throne.

We beg leave in this our expression of loyalty to associate Her Most Gracious Majesty Queen Elizabeth who by her devotion to the common good of the people, has won the affection and admiration of Your subjects. It is our fervent

hope that Your Majesties may have many years of happiness together and that Your Reign may be long, illustrious and blest with peace

Signed on behalf of the British Medical Association,

E. Farquhar Buzzard, President

E. Kaye Le Fleming, Chairman of Council

H S Souttar Chairman of Representative Body

N Bishop Harman, Treasurer

King George VI as Patron of the Association

5 The Association has received a memorandum from the Privy Purse Office, Buckingham Palace, intimating that His Majesty King George VI is pleased to become the Patron of those Societies and Institutions recently granted Patronage by King Edward VIII. The Association thus continues the Royal Patronage with which it has been so long honoured

Honours

6 The Council has pleasure in announcing that during the present session His Majesty the King has conferred honours upon the following members, to each of whom the congratulations of the Association have been sent

OBITUARY

7 The Association has to deplore the loss of the following members. Their names are followed by the offices they respectively held in the Association

DR CASEMENT GORDON AICHA, President, New Zealand Branch
Chairman Auckland Division

DR ALEXANDER BALLANTYNE, Chairman Southport Division.

DR STEPHEN EDWARD BAXTER, President South Midland
Branch. Representative Northampton Division.

DR HOWARD BARCLAY BILLUPS, Chairman, Isle of Wight Division
SIR JOHN BLAND-SUTTON BART, Secretary 1895, Vice President,
1910, Section of Surgery

SIR ALFRED PERCY BLENKINSOP, Member of Council, Secretary,
Section of Navy, Army and Ambulance, 1910

DR LOU'S CHARLES SOUTHALL BROUGHTON, Chairman, West
Bromwich and Smethwick Division

DR JOHN HENRY CHAMBERS, President Isle of Man Medical
Society (Isle of Man Branch)

DR LUCIEN MILBOURNE CLARK, President Jamaica Branch

DR ARTHUR WARD COLLINS, Chairman Furness Division

DR ALBERT ERNEST COFE, Representative, Westminster and
Holborn Division, Member Insurance Acts Committee.

MR FRANK PEARSON SAEFFINGTON CRESSWELL, Secretary, 1906.
President, 1928, Section of Ophthalmology

DR SYDNEY WALTER CURL, Chairman North East Essex
Division

DR GEORGE WARWICK BAMPFYLDE DANTELL, Representative,
Cape of Good Hope Western Branch, Vice President, Section
of Anaesthetics, 1932

DR GURTH EAGER, Secretary, East Hertfordshire Division.

LT COL. ROBERT HENRY ELLIOT, Member of Council, Representa-
tive, South Indian and Madras Branch, Vice President,
Section of Naval and Military, 1920, Vice President, Section
of Ophthalmology 1921

COL. CHARLES ROULSTON ELLIOTT, Chairman and Representative,
North East Essex Division

DR ARCHIBALD FAIRLIE, President, North of England Branch
Chairman and Representative Blyth Division

DR JOHN NORMAN CHUBA FORD, Secretary, Section of Ob-
stetrics and Gynaecology, 1931

DR THOMAS FORREST, Chairman Glasgow Southern Division

DR GEORGE ROY FORTUNE, Vice Chairman, Newcastle-on
Tyne Division

PROF DAVID FRASER HARRIS, Secretary Section of Anatomy
and Physiology 1911

DR ARCHIBALD GILLESPIE, Chairman East Yorkshire Division
DR JOHN MAXWELL GOVER, Chairman, Newcastle-on Tyne
Division

DR ALFRED GREENWOOD, President Kent Branch, Representative,
Maidstone Division, Member, Public Health Committee

SIR WM HEATON HAMER, Chairman, St Pancras Division.
Secretary Section of Public Medicine 1902

DR JOHN HERN, Chairman and Representative, Darlington
Division

DR JAMES HILL, President Glasgow and West of Scotland
Branch, Chairman, Renfrewshire and Buteshire Division

DR WM HUNTER, Secretary, Section of Pathology and Bac-
teriology, 1897, Vice-President, Section of Pathology, 1907

Vice-President, Section of Medicine, 1911

DR ORLANDO INCHLEY, Secretary Section of Physiology,
Pharmacology, Therapeutics and Dietetics 1921

DR. GEORGE WM NEILD JOSEPH, Member Public Health
Committee, Secretary Section of Public Medicine and In-
dustrial Diseases 1924

MR THEODORE HARTMANN JUST, Secretary, Section of Laryn-
gology and Otology, 1924, Vice President, Section of Oto-
Rhino-Laryngology 1934

DR JAMES TYSON KITCHIN, Secretary, Section of Medical
Sociology 1924

DR. HERMAN FERMOR LAWRENCE, Vice President, Section of
Dermatology 1935

DR FRANK WHITWELL KINNEAR LAWRIE, Chairman, North
Northumberland Division

DR. CHARLES JAMES LEWIS, Vice-President, Section of Pathology,
1911

DR. DAVID MCASKIE, Chairman and Representative, Ports-
mouth Division

DR DONALD CAMERON MACASKILL, President, Malaya Branch.
Chairman Federated Malay States Division

DR DUNCAN ROBERT MACDONALD, Chairman Lothians
Division

DR. THOMAS WM McDOWALL, Representative Morpeth
Division

PROF JOHN ALEXANDER MACWILLIAM, Vice President 1898
President 1922, Section of Physiology, Vice President, Section
of Anatomy and Physiology 1914

DR HAMILTON CLELLAND MARR, Vice President, Section of
Mental Diseases 1927

DR HUGH MEYRICK MEYRICK JONES, President Gloucestershire
Branch, Secretary, Section of Radiology and Radio-Thera-
peutics 1929

DR JOHN INNES MOIR, President British Honduras Branch

THE RIGHT HON. LORD MOYNHAN OF LEEDS, Vice President
of the Association, President, Section of Surgery 1925, 1930
and 1932.

DR. KENNETH FRANCIS MULLIGAN Chairman, Monmouthshire Division
 DR. HENRY TEMPLE MURSELL Representative Johannesburg Division
 DR. IAN OGILVIE Chairman, Warrington Division
 DR. HESLOP LAIRD PEARSON Representative, Birkenhead Division
 DR. EDITH CICELY PHILIPS Secretary, Tower Hamlets Division
 Member Anaesthetics in Midwifery Committee
 DR. ROBERT LACHLAN PINKERTON Chairman Croydon Division
 DR. ROBERT GEORGE RIDDELL Chairman Torquay Division
 SIR JOHN ROBERTSON Secretary, Section of State Medicine
 1903 Vice President Section of State Medicine and Industrial Diseases 1911
 DR. JOHN WM ROWLANDS Chairman and Representative, South Caernarvon and Merioneth Division
 DR. JOHN ENSLIE SKINNER President, Aberdeen Branch
 Representative, Aberdeen Division Member, Scottish Committee
 DR. JOHN SMALE President, North of England Branch Representative, Darlington Division
 DR. FRANCIS VICTOR SMALL Secretary Uganda Branch
 DR. HUGH ROSS SOUPER Chairman City of Aberdeen Division
 Secretary Section of Orthopaedics and Diseases of Children 1921
 DR. FREDERIC WILSON STANSFIELD President, Oxford and Reading Branch Chairman, Reading Division
 DR. JAMES ERNEST STRATTON Chairman Camberwell Division
 DR. EDWARD MERVYN THOMSON Chairman Westminster and Holborn Division
 DR. RICHARD TIMMIS TURNER Chairman, Crewe Division
 DR. WILLOUGHBY MASON WILLOUGHBY President, Section of Public Medicine, 1936
 DR. FREDERICK ERNEST WITHERS Representative, Lincoln Division

Representation on Outside Bodies

8 During the session the following appointments and reappointments have been made by the Council

Health and Comfort Conditions in Housing Dr E H Snell, Council of Society of Medical Officers of Health
 Sir Henry Brackenbury, Dr W Paterson Committee of Management of the Royal Medical Benevolent Fund
 Dr C O Hawthorne Child Guidance Council Dr R Langdon-Down, Board of Governors of University College of Hull Dr D M Mackay, Central Council for Care of Cripples Mr W McAdam Eccles, Mr P Jenner Verrall, Association of Special Libraries and Information Bureau
 Dr S Monckton Copeman, National Central Library
 Dr C O Hawthorne, National Ophthalmic Treatment Board Mr N Bishop Harman, Dr P Macdonald Mr J D M Cardell, Governing Body of the British Post-Graduate Medical School Sir Henry Brackenbury, Joint Committee of Epsom College and its Royal Medical Foundation Dr L G Glover Poisons Board Dr J W Bone Board of Directors of the Scholastic Medical and Clerical Association Ltd (British Medical Bureau)
 Mr N Bishop Harman Dr J W Bone Sir Humphry Rolleston, Dr J D Ewart Sir Robert Bolam Advisory Committee of the International List of Causes of Death Dr C O Hawthorne Council of Empire Rheumatism Campaign Dr F G Thomson Central Council for Health Education Dr A N Mathias Dr Charles Hill Dr H C Boyde, Joint Council of Midwifery Professor James Young

DELEGATES OF THE ASSOCIATION TO CONFERENCES OF OUTSIDE BODIES -

9 During the session the following members have been appointed delegates to represent the Association at the conferences indicated

48th Royal Sanitary Institute Congress Prof R M F Picken 7th English Speaking Conference on Maternity and Child Welfare Dr W H F Oxley Eighth Imperial Social Hygiene Congress Dr W G Willoughby, Annual Conference of National Association for the Prevention of Tuberculosis Sir Robert Philip

Protection of Practices of Members Joining His Majesty's Forces

10 The Council is considering the following Minute 155 of the A R M 1936, and it hopes to be in a position to deal with the matter in its Supplementary Report

Minute 155—Resolved That the Council be asked to consider the advisability of the appointment of a committee to consider the protection of the practices of members of the medical profession who join His Majesty's Forces in times of national emergency

Gifts to the Association

11 The Council has pleasure in reporting the following gifts

By Mrs Elizabeth Fergusson, a framed crayon portrait of Dr Richard Thomas Hunt one of the Founders of the Association in conjunction with Sir Charles Hastings

By the Wellcome Foundation, Ltd a replica of the medal struck in honour of Dr Frederick Belding Power, who for over 18 years was the Director of the Wellcome Chemical Research Laboratories, London, and later became Director of the Phyto-chemical Research Laboratory of the Bureau of Chemistry, United States Government, Washington

Introduction of National Health Insurance in New Zealand

12 A national health insurance scheme is being introduced into New Zealand this year and in view of the far-reaching effects of such a measure upon the position of the medical profession in the Dominion the New Zealand Branch appealed to the Council for the help of an expert to guide them in their negotiations with the Government The Branch suggested that if Sir Henry Brackenbury would consent to go to New Zealand his assistance would be extremely valuable to the Branch The Council has had much pleasure in acceding to the request of the New Zealand Branch and is glad to report that Sir Henry Brackenbury has consented to visit New Zealand as the representative of the home Association

Joint Standing Committee of B.M.A. and Trades Union Congress

13 The Council has considered a communication from Sir Walter Citrine the General Secretary of the Trades Union Congress General Council, stating that for some considerable time that body had had under consideration the possibility of a closer working link between the trade union movement and the medical profession that it felt there was a wide range of subjects which would provide a source of co-operation between themselves and the medical profession as a whole and that it was of opinion that the establishment of a Standing Joint Committee to deal with such subjects including possible differences on local medical schemes would prove of value to all concerned The Association was invited to represent the medical profession on such a Committee The Council, believing that a ready interchange

of views between the two bodies could result only in mutual good in the public interest decided to accept the invitation The Joint Committee consists of seven nominees of the British Medical Association and seven nominees of the General Council of the Trades Union Congress The following have been appointed as the Association's representatives on the Joint Committee Chairman of Council, Dr J W Bone, Sir Henry Brackenbury, Dr H G Dain Professor R M F Picken, Dr H W Pooler, and the Medical Secretary

It should be understood that the Committee is purely advisory in character, and that each side will be free to bring forward any relevant questions upon which it desires the advice of the Joint Committee The autonomy of the Association and of the Trades Union Congress General Council will be in no way impaired, although each will naturally seek the views of the Joint Committee on questions of mutual interest

One of the first questions dealt with by the Joint Committee related to the Factory Bill at present before Parliament. Upon certain aspects of this measure representations were made to the Home Secretary

Association Office Arrangements

14 The Council, after a careful investigation of the whole of the circumstances, has come to the conclusion that the present Association organisation for the production of the *British Medical Journal* is not satisfactory and that there is need for the appointment of two new officials to give their whole time to the work of the *Journal* under the direction of the Board of Directors of the *British Medical Journal* to which reference is made in para 57 of this Report The Council has therefore decided that directly responsible to the Board of Directors on matters of *Journal* production there should be two officials, (1) a whole time secretary to the Board, whose duties would comprise, in addition to the secretaryship of the Board, the preparation of the *Journal* accounts, the supervision of the publishing and dispatch arrangements, and the *Journal* records, and any receipt of money on behalf of the *Journal*, and (2) an advertisement manager who should be responsible for all business connected with advertisements except the collection of accounts As these decisions necessitate such a radical change in the terms and conditions of the office of Financial Secretary and Business Manager, the Council has decided that that office in its present form be abolished at the end of six months, and it has accordingly given notice to the present holder, Mr L. Ferris Scott, to terminate his appointment at that date

The Council is proceeding further with its inquiry into Association office arrangements

Proposed Investigation of Umckaloabo

15 In its Supplementary Report in June, 1936 the Council stated that it had been approached by a lay body known as the Committee of Investigation on Treatments of Tuberculosis for advice and assistance in reference to a proposal to investigate Umckaloabo a substance known to many members of the profession as Stevens' Consumption Cure As a result the Council prepared a statement upon the position which was submitted to the Committee of Investigation and published in the Supplement of June 27th 1936

In reply to a further communication received from this Committee the Council repeated its former advice that laboratory tests directed to determine the action positive or negative of Umckaloabo on the tubercle bacillus should be arranged, and that an agreed number of patients reported as cured under the administration of Umckaloabo should be examined by an expert physician relative to their history and present condition

The Council further suggested that a complete knowledge of the source of supply and of the chemical and physical properties of Umckaloabo should be obtained and it urged the Committee of Investigation to meet the conditions under which the Medical Research Council conducted its enquiries

Association Professionnelle Internationale des Medecins

16 The Council submits the following report of the Association's correspondent the Medical Secretary, on the Eleventh Annual Conference of the above-mentioned body.

I attended the eleventh annual conference of the APIM, which was held in Amsterdam last September. The President was Dr Mattlet of Belgium, and the following countries were represented: Belgium, Czechoslovakia, Denmark, France, Germany, Great Britain, Holland, Hungary, Luxembourg, Norway, Spain, Sweden and Switzerland.

The Secretary Dr Decourt presented his annual report, in which he said that the increase in the average number of correspondents replying to the questionnaires was evidence of an increased interest in the work of the APIM. He appealed, however, for more contributions from correspondents on medico-social topics for the *Revue*. The report of the Treasurer Dr Fortuyn showed a small deficit. The cost of administration had been reduced to the lowest possible level consistent with efficiency and the Conference was asked to agree to the issue of an official letter to those national organisations which continually failed to pay their subscriptions. This course was adopted and the Secretary's draft letter appealing for more active support and warning defaulters that continued failure to pay their subscriptions might lead to exclusion from the privileges of membership was approved. Dr Decourt said that he realised that there was difficulty in certain cases owing to the prohibition of the export of capital. The German National Association had overcome this difficulty by undertaking the printing in Berlin of four numbers of the *Revue*, and the Hungarian organisation proposed to pay its debt in kind in a similar way. Danzig and Portugal had withdrawn from membership during the year, the former on financial grounds and the latter owing to the absence of a national medical association.

THE WORK OF THE CONFERENCE

The work of the Conference consisted chiefly in the discussion of the questionnaires and questions issued during the year. Three questionnaires had been issued with the following subjects:

- (1) Private and voluntary sickness insurance for middle-class and professional persons
- (2) The repercussion of sickness insurance on the practice of medicine
- (3) Hospital organisation

In addition, two questions had been submitted by Poland and Switzerland. The Polish association asked for information on medical chambers and professional organisations, and the Swiss association asked what alterations had been made in the provision for first aid in accident cases since the issue of the questionnaire on this subject in 1929.

SICKNESS INSURANCE FOR MIDDLE CLASSES

Dr Csillery, the representative of Hungary, acted as the reporter of this enquiry. He found that most of the seventeen countries from which replies were received possessed facilities for private sickness insurance for middle class and professional persons. The nature of the facilities naturally varied considerably with respect both to organisation and to benefits offered. Most of the organisations had developed without the co-operation of the medical associations, but the majority of the replies expressed approval of the principle of providing such insurance. After a general discussion certain resolutions were passed by the Conference approving the principle of schemes of private and voluntary sickness insurance and recommending that institutions established for the purpose should co-operate with the medical profession, which should be represented in their administration and direction. The conditions on which the profession should agree to co-operate should include such principles as free choice of doctor and patient, the preservation of professional secrecy, and the control of all medical matters by medical practitioners.

EFFECT OF SICKNESS INSURANCE ON THE PRACTICE OF MEDICINE

The results of the questionnaire on the effect of sickness insurance on the practice of medicine revealed a position in many Continental countries which happily does not exist in Great Britain. The reporter, Dr Fortuyn of Holland, found that sickness insurance and social health legislation tended to diminish private and family practice of medicine, for the measures which had been begun for persons of modest means had gradually extended their scope to include persons in easier circumstances. Moreover the substitution of the insurance doctor for the family doctor tended to substitute standardised treatment for the treatment of the individual patient and the creation of collective institutions had in most countries undermined the independence of the medical organisations. While most of the latter regarded the loss of their influence as unfortunate for both patients and doctors, some were content to accept it as a natural evolution. After considering Dr Fortuyn's report the Conference reiterated the principles it had already formulated in its International Medical Charter.

HOSPITAL ORGANISATION

The report submitted by Dr Cibré, the French representative on the question of hospital organisation illustrated the fundamental difference which exists between this country and most Continental countries on the question of the basis of hospital provision. The report on the replies to the questions, which were mostly concerned with public hospitals and the motions submitted by the reporter showed that the Continental mind visualises hospital accommodation as being sharply divided into two categories: one for necessitous persons for whom the State must make provision and the other for those persons in easy circumstances who can afford to pay for their maintenance and treatment. It was proposed to formulate a separate policy for "public" hospitals, the principles including one that these hospitals should be reserved for the poor and necessitous and another that members of medical staffs of public hospitals should receive a small remuneration.

I explained to the Conference that in Great Britain admission to local authority hospitals was based on medical need and not on social or financial circumstances. I pointed out that the term 'poor and necessitous' was misleading, because about 80 per cent of the community were poor in the sense that they could not afford to pay the full cost of their hospital services. They endeavoured however to meet the cost by means of insurance, and they could not therefore be regarded as 'poor and necessitous' and deserving of charity. I also submitted that, if 80 per cent of the community receive from the hospital the essential services which it alone can provide, the remuneration of the medical profession should not be small, on the contrary, it should be substantial. My point of view was evidently quite new to some of those present, although during the discussion that followed I was glad to observe that the majority of the representatives agreed with the point of view I had advanced.

The Conference finally came to the conclusion that in view of the fundamental differences existing in the various countries, the formulation of an international hospital policy was impossible, but it passed a resolution expressing its opinion that in each country there should be prepared a carefully considered policy for the development of hospital organisation and accommodation.

PROGRAMME FOR 1937

It was arranged that the questionnaires for 1937 should be on the following subjects:

- (1) The campaign against cancer
- (2) Methods of controlling the patient and the doctor in medico-social legislation
- (3) Organisation of a night medical service and a service for Sundays and holidays

The next Conference is to be held in Paris in July, 1937, under the presidency of Dr Haedekamp, the representative for Germany.

Council Dinner

17 The Council Dinner was held on November 10th, 1936. The guests included the Minister of Health, the Secretary of State for India, the heads of various Government Departments with which the Association has relations, and the medical departments of the Defence Forces, the Presidents of the Royal Colleges, the officers of kindred Associations and Societies, various civic authorities, Members of Parliament, etc. The dinner proved a most successful function.

Hospitality to Over-seas Members

18 The Council has arranged to hold a reception to which will be invited those members of the Association from over seas who are visiting this country in connexion with the Coronation Celebrations.

A Radiology Group

19 The Council has, on the petition of members interested, formed a Radiology Group within the Association. The Group is composed of all those members of the Association who are engaged predominantly in the practice of radiology.

A Psychological Medicine Group

20. The Council has, on the petition of members interested, formed a Group of Practitioners of Psychological Medicine within the Association. The Group is composed of all those members of the Association who are engaged predominantly in the practice of psychological medicine.

Health Services

21 The Council appointed a Special Committee to consider the following Minutes 130, 142 and 154 of the A.R.M. 1936.

Minute 130—That the Representative Body deprecates the increasing tendency for the employment by Municipal Authorities of part-time and salaried medical officers not engaged in private practice for the performance of clinical work within the sphere of private practice, as this must lead to overlapping and waste and (a) considers that in the public interest and on medical grounds the services of local private practitioners should be utilised for all clinical work wherever their suitability and competence, and other local circumstances permit, and (b) requests the Council to take whatever steps it considers desirable to represent these views to the Minister of Health.

Minute 142—That the Council be asked to appoint a Special Committee to consider the Departmental Report on Scottish Health Services and to make recommendations as to (1) any necessary alterations in the documents setting forth Association Policy on Health Services and (2) what steps should be taken to secure that so far as possible, any legislation arising, directly or indirectly from the Report, shall conform with Association policy.

Minute 154—That the time has now come when the Council should consider the taking of more active steps towards implementing the Association's proposals for a General Medical Service for the Nation.

and will refer to this subject in its Supplementary Report.

Council Attendances

22. A list of attendances at meetings of Council from the Annual Representative Meeting, 1936, to April, 1937 will be found in Appendix I.

FINANCE

23 The Balance Sheet and Accounts for the year 1936 as audited by Messrs Price Waterhouse & Co. and presented to the Council by the Finance Committee, disclose the steady and cumulative progress made by the Association in recent years. The decision taken last year to close the printing department of the Association has released the

Reserve Fund which had been raised for the eventual replacement of the Printing Machinery and the assets thus released have been transferred, together with an allocation of £15,000 in respect of 1936 to a new 'Reserve Fund against commitments for Extensions of Premises'.

The Association entered in 1929 into engagements to build further additions to the House of the B.M.A. and Tavistock House, and in the latter half of 1937 a commencement of this work must be undertaken.

Towards this expenditure a reserve of £26,716 5s has thus been provided, represented by trustee securities of the market value at December 31 1936, of £27,004.

A balance of £1,612 2s 8d, after providing for adequate depreciation and allocation to reserves, has been added to the Surplus Account, which now stands at £279,086 19s 2d.

Although the future obligations of the Association are heavy, the financial record of recent years proves that they may be faced with confidence.

The balance or surplus of assets over liabilities at the end of 1936 was £331,609 7s 3d, an increase in the capital value of the Association's property during 15 years of £190,998 14s 6d, arrived at after providing sums amounting to £66,401 6s 7d for depreciation on B.M.A. property, buildings and contents.

In addition there is an unrealised profit in the market value of investments of £6,768, and in the surrender values of the Sinking Fund Policies of £1,070.

An unusual item appears amongst the creditors. An Assistant Medical Secretary of the Association died on December 8 1936 and the surrender value of the Deferred Annuity Bond taken out on his behalf was held in trust upon deposit pending transfer to his legal personal representatives. This transfer has now been effected.

The overdraft shown at the Bank was purely a temporary book accommodation repaid in the first days of 1937.

The Leasehold Premises in London and the houses held by Feu Charter in Edinburgh have again been written down in value.

Similarly, percentages of depreciation have been written off such assets as the Library, Furniture and Office Equipment, Plant and Type.

The Subscriptions in arrear are largely represented by overseas subscriptions collected locally which have not reached the Head Office. The figure for 1936 includes £817 8s 6d for 526 subscriptions from the Irish Free State remitted on February 2 1937. Such subscriptions were previously collected from London instead of Dublin. The very large proportion of subscriptions carried forward as in arrear which are collected in the following year, is set out later in this report.

The Reserve for Bad Debts and Discounts is adequate to meet any possible loss from this source.

Income and Expenditure Account

The income for the last three years has been as follows

	£	s	d
1934	154,821	3	0
1935	160,090	6	4
1936	166,870	17	8

The expenditure after allowing for all transfers to Sinking Fund and Reserve Accounts, including provision towards the cost of completing the existing front building, has been

	£	s	d
1934	152,277	17	0
1935	158,121	18	0
1936	165,258	15	0

so that a net sum in the books of £1 612 2s 8d has been added to the Surplus Account.

Subscriptions

24 The membership of the Association at December 31, 1936 was 36,290 an increase on the year of 907.

The subscription income for 1936 increased by £979 0s 1d the subscriptions in arrear collected for the previous year.

decreased by £6 3s 7d, but in respect of former years subscriptions previously written off an additional £32 16s 3d was recovered making a total increase of £1,005 12s 9d

It has on previous occasions been pointed out that of the sum carried forward in the Balance Sheet as 'Subscriptions in Arrear' the great majority are rapidly paid up. The Balance Sheet at December 31, 1934, included such an amount of £3 70s 5s 5d of which no less than £3 26s 7s 2d was recovered during 1935, leaving a balance of £442 5s 3d to be included in the sum of £3,937 4s 1d written off at the end of 1935. During the past year further amounts have been received on account of the previous and former years amounting to £2,772 19s 11d, as set out in the income and expenditure account.

Similarly out of the sum of £3,937 8s 6d carried forward in the Balance Sheet dated December 31, 1935, no less than £3 47s 1s was recovered during 1936, leaving an outstanding balance of £461 7s 6d.

Rents Received and Accrued

25 Further lettings and the readjustment of tenancies in Tavistock House have shown an increase during 1936 but the full effect of the changes will not be seen until the accounts for 1937 are prepared.

Interest on Investments

26 As moneys have become available they have been invested, until required, in Trustee securities.

National Ophthalmic Treatment Board

27 The larger return during the year is gratifying as showing the increasing success of the scheme. The sum is not however a source of revenue but a repayment of expenditure previously made, the further amount which can be received under this heading being limited to £305 8s 6d.

The Agreement for this advance made no provision for interest.

ABSTRACT A

"Journal" Revenue

28 An increase in the Revenue from Advertisements had been anticipated but the amount actually earned during the year exceeded the estimates made.

The following are the comparative figures of pages

	1935	1936
Literary and Epitome	2,848	2,892
Supplement	620	724
Advertisement	3,284	3,500
	6,752	7,116

The decrease in the sale of *Journals* to non-members which follows almost automatically upon the expansion in the membership of the Association has received notice on previous occasions.

The revenue from royalties upon the sale of publications bearing articles collected and reprinted from the *Journal* will be noted with interest.

"Journal" Expenditure

Editorial—It has been found desirable to extend the system by which the Editor had the advice and assistance of a pharmacologist, and to provide him with specialist advisers in other branches of medicine.

Managerial—It had been intended to close down the composing department of the B.M.A. at the end of December, 1936 but for technical reasons connected with new machinery ordered by the new printers it was found necessary to continue the production of the new *Journal* during the first three months of 1937 in the House of the Association by the

compositors in direct employment the printing machining and distribution were continued by Odhams Press. For this reason there appears in the Balance Sheet for 1936 a purchase of printing plant the cost of which will be partly recouped to the Association when the new system of production is commenced. Similarly action taken in connection with the sale and realisation of printing machinery and plant and the disposal of the composing room staff will be reported with the accounts for 1937.

Compositors Wages Machining etc—The costs chargeable under these headings are dependent not only upon the total number of pages and the total number of copies of the *Journal* produced, but also to some extent upon the various 'sizes' in which the weekly issues of the *Journal* must be made, and the amount of material which has to be set and corrected, used, or destroyed as 'cancelled matter'.

The weekly issues of the *Journal* were made up as follows:

	1935	1936
100 pages	—	1
104	2	—
108	3	1
112	1	1
116	3	1
120	7	1
124	4	3
128	5	5
132	6	9
136	7	6
140	4	9
144	5	6
148	2	3
152	1	—
156	2	3
160	—	1
172	—	1
176	—	1
	52	52

The total number of pages in the year increased from 6,752 to 7,116, the number of copies printed from 1,989,250 in 1935 to 2,029,340 in 1936.

Paper—The paper now used for the *Journal* has been standardised as affording a reasonable result under the conditions governing the production of the *Journal*. New contracts have been entered into by the Board which will offset to a considerable extent the great rise in the general market price of the commodity.

Postages—The larger journals produced have the effect of increasing considerably the cost of postage both for the home circulation and the foreign. The increase of £1,132 6s 1d is partly due to the wider circulation, but partly also to the heavier weekly issues.

Advertising and Changes—The expenditure under the headings of Propaganda Booklets and in connection with changes in the format of the *Journal* is not necessarily recurrent.

The expenditure of the newly constituted Board of Directors of the *British Medical Journal* appears for the first time.

ABSTRACT B

29 The activities of committees of the Association are fairly set out in detail from a financial point of view in Abstract B.

The holding of the Annual Meeting again in Great Britain (at Oxford) involved considerably less expenditure in 1936 than in 1935.

Representative Meeting—The attendances for which railway fares have been paid during the last three years have been as follows:

In 1934	Bournemouth	238
" 1935	London	183
" 1936	Oxford	241

Council—The attendance at Council Meetings

In 1934 incurred 206 fares	
1935	185
1936	189

Committees—The *Arrangements Committee* meeting in connection with the Meeting at Belfast involved heavier railway fares

The *Health Services Committee* has been recently set up but the Committees on *Fractures*, *Indian Medical Service*, *Medical Education*, *Nutrition* and the *Relation of Alcohol to Road Accidents* have discharged their references

The figures shown in connection with the *Insurance Acts Committee* are as usual net allowances having been made for reimbursement by the National Insurance Defence Trust of the following items

	£	s	d
Railway Fares 1936	233	12	10
Printings	109	4	4
Clerical Assistance	252	10	0
Postage and Sundries	41	8	10
	£636	16	0

Organisation—The Articles and By-Laws of the Association were reprinted, but not the Medical Practitioner's Handbook, during 1936. In accordance with decisions previously taken the fares of newly appointed Honorary Secretaries of Divisions and Branches who visit the Head Office are paid

ABSTRACT D

30 *Legal Charges*—The heavy expenditure during 1935 incurred in the successful opposition organized against the Osteopaths Bill had no counterpart in 1936

Grant to Australian Federal Council—This grant of £1 000 towards the expenses of the Federal Council in Australia is paid in Australian currency the advantage of the exchange rate remaining in this connection with the Association

Indian Tour—A full report is made elsewhere as to the tour of the Indian Branches undertaken by the Medical Secretary

ABSTRACT E

31 *General Repairs*—In the report presented last year it was pointed out that the amount expended upon repairs and upkeep had been considerably reduced during 1935, the amount required, however will necessarily vary from year to year

Rates—The increase in the rates levied was foreshadowed last year

Electricity and Gas—There has been an increase in the cost of lighting the corridors, entrances, etc. for tenants in Tavistock House. This is offset by rents received

ABSTRACT F

32 There have been certain increases paid to the staff under the approved scale of salaries

Under the heading *Premiums of Deferred Annuities for Officials* have been included the premiums in respect of recently appointed officials, and alterations in remuneration

The reduction shown under the heading *Annual Meeting Expenses* is slightly modified by the extra cost of travelling and subsistence incurred by Officials and Staff

TRUST FUNDS

33 *Office Staff Superannuation Fund*—The Actuary is satisfied with the present position of this Fund and has advised as to variations in the rates of contributions. A full revaluation of the Fund in connection with the obligation to each member thereof will take place shortly when the effects of certain renewals can be seen

Sir Charles Hastings Fund—It is satisfactory to note that the upward trend has continued in the market value of some of the securities representing the original capital of this Fund although for a time such investments had only a nominal value

Katherine Bishop Harman Fund—*Middlemore Fund*—Prizes have been awarded from the income of these Funds

Charities Trust Fund—It had been hoped that greater progress would have been made, but the grants which are allocated to the medical charities are of great assistance, are gratefully received and judiciously applied

ORGANIZATION**Membership**

34 The following is a summarized statement of the changes in the membership of the Association during 1936, as compared with 1935

	1935	1936
New Members	1,856	2,267
Paid arrears	1,280	1,290
Resignations withdrawn	50	21
	3,186	3,578
Resignations	767	685
Deaths	389	370
Arrears	1,675	1,614
Expelled	1	—
Erased under Art 9 (c) (ii)	—	2
	2,832	2,671

Membership December 31st 1935	35 383
Membership December 31st 1936	36 290

Work of the Divisions, Branches and Federal Councils

35 Annual Reports for 1936 have been received from the majority of the Divisions and Branches and show continued and increasing activity throughout the wide field covered by the Association. The interest taken by the local units in clinical scientific and social matters is noted with particular pleasure. An attempt is being made to rekindle activity in the few unorganized or inactive Divisions in England and Wales. In this connection it should be remembered that it is only by the continued interest of members in local affairs and by their active support of the local unit that the Association can function effectively in their interests

On behalf of the Association, the Council wishes to thank the chairmen, presidents, secretaries, treasurers and executives of the Divisions, Branches and Federal Councils for their unselfish and unstinted work on behalf of the profession and of the Association

New Divisions and Branches and Alterations of Area

36 Since the A.R.M. 1936 the Council has formed new Leicester and Rutland and Nottingham Branches in place of the former Midland Branch. Readjustments have been made in the areas of certain Divisions with a view to increasing their effectiveness, and other possible readjustments are under consideration

As a result of the visit of the Medical Secretary to the Indian Branches new Delhi North West Frontier, and Sind Branches have been formed and arrangements are in train for the formation of Bihar and Central Provinces Branches

It is proposed also to form a Mauritius Branch. The Council has approved pursuant to Article 12 and By-laws 19 and 20 an application for incorporation by the Cyprus Branch, formed in February, 1936

Financing of Branches not in Great Britain and Northern Ireland

37 The Council has continued to apply to certain Branches outside Great Britain and Northern Ireland the system of variable capitation grants (a system which has

been applied for many years to home Branches) according to needs as shown by annual reports received. Two overseas Branches agreed to forgo capitation grants in respect of 1936.

The Association's Annual Handbook, 1936-37

38 In accordance with the usual procedure the *Annual Handbook* has been issued gratis to those members who have applied for it, as well as to presidents, chairmen, and honorary secretaries of Branches and Divisions and other persons and bodies closely associated with the work of the Association.

Medical Practitioners' Handbook

39 The Association's *Medical Practitioners' Handbook* (which superseded the *Handbook for Recently Qualified Medical Practitioners*) and which was published in October 1935 has met with marked success and has proved to be particularly useful to the recently qualified members of the profession. Copies of this *Handbook* are obtainable (3s 6d or post free 3s 10d.) from the Financial-Secretary and Business Manager, or from any bookseller.

Medical Students and Newly Qualified Practitioners

40 All the Branches and Divisions in the British Isles in whose areas medical schools exist conduct an active propaganda on behalf of the Association among the medical students and newly qualified practitioners in their areas.

Of the practitioners qualifying in Great Britain and Ireland in the year October 1934, to September, 1935, 43 per cent joined the Association within one year of registration.

Election of Representatives, 1937-38

41 The Council has repeated the 1936-37 grouping of the Divisions in Great Britain and Northern Ireland for election of Representatives 1937-38 except that the Leicester and Rutland and Nottingham Branches (which have replaced the Midland Branch) have been created independent constituencies. The Branches in the Irish Free State have three Representatives in the Representative Body. Each Division and Division-Branch outside Great Britain and Ireland has, as in previous years, been made an independent constituency. The complete list of constituencies appeared in the *British Medical Journal Supplement* of April 17, 1937.

Conference of Honorary Secretaries, 1937

42. The conference of Honorary Secretaries of Divisions and Branches in Great Britain and Northern Ireland will be held at Belfast in the afternoon of Wednesday July 21, 1937. The Secretaries' Dinner will be held the same evening.

AMENDMENTS TO ARTICLES AND BY-LAWS

"Associates" and "Associateships"

43 The Aden and Sudan Branches expressed a desire to elect to a special or restricted form of membership those practitioners who although eligible to practise locally, did not possess a qualification registrable in this country. The Council has considered the matter and is of opinion that the situation can best be met both in these Branches and elsewhere by an alteration of the By-laws to enable Overseas Branches to elect "Associates" of the Branch. Such Associates would not be members of the Association and would be persons who are not eligible for membership. The Branch electing them would decide the privileges which such Associates should have, and subject to the approval of the Council the amount of subscription payable by them. Associates would not in any event be entitled to vote either at meetings or in a postal vote. Arrangements would be made for the making of capitation grants by the Council to the Branches concerned in respect of subscriptions received from such Associates.

Existing By-law 25 (2) (vi) empowers Overseas Branches to adopt, without the sanction of the Council a rule providing for the election as members of the Association of "practitioners not registered in Great Britain or Ireland." The Council proposes that in future any such rule should be subject to its sanction (see proposed amendment to By-law 25 (2) (viii)).

Discontinuance of Annual List of Members

44 The Council is of opinion that the publication of the Annual List of Members of the Association serves no useful purpose, and it is supported in this view by a resolution adopted by the Conference of Honorary Secretaries at Oxford in 1936. The Council is advised that there is no legal obligation upon the Association to publish such a List, and it therefore proposes that publication should be discontinued. It should be clearly appreciated that there is no intention of discontinuing the periodical supply to Branch and Division Secretaries of lists of members of their respective Branches or Divisions.

The Council submits amendments to the Articles and By-laws to give effect to the foregoing proposals and recommends

Recommendation That the amendment to the Articles and By-laws contained in Appendix II be adopted and that the Council be instructed to submit the amended Articles to the necessary General Meeting of the Association for approval.

Members of more than 50 Years' Standing

45 The Council is of opinion that the two guineas subscription for members of the Association of fifty or more years standing constitutes a real hardship in some cases. As the number of such members is small the Council feels that it would be a graceful gesture on the part of the Association to make it possible for them to continue their membership without further payment of subscription. The Council therefore recommends

Recommendation That Articles 5 and 6 and By-law 14 be amended as follows, and that the amendments to Articles 5 and 6 be submitted to the necessary General Meeting of the Association.

Page 10, Article 5, Line 1

Before By-laws insert Regulations or

Add at end

Provided always that in the case of any person who shall have been a Member of the Association for a period of 50 years no further annual subscription shall be payable as from the 1st of January next succeeding the expiration of such period or in the case of existing Members who have been Members for more than 50 years then as from the 1st January 1938 but so that this proviso shall be without prejudice in the case of a Member who is a Member of a Corporate Branch or of a Corporate Group to his obligations as such Member of the Corporate Branch or of the Corporate Group.

Page 10, Article 6

Add the following additional paragraph

Provided further that in the case of any person who shall have been a Member of the Association for a period of 50 years such person shall without payment of any annual subscription, as from the 1st January next succeeding the expiration of such period or in the case of existing Members who have been Members for more than 50 years then as from the 1st January 1938 and during the continuance of his Membership be entitled to all the privileges aforesaid but so that this proviso shall be without prejudice in the case of a Member who is a Member of a Corporate Branch or of a Corporate Group to his obligations as such Member of the Corporate Branch or of the Corporate Group.

Page 38 By-law 14 (1) Line 2

After shall insert in the case of Members (not being persons who shall have been Members of the Association for a period of 50 years or more)"

Add at end of By-law 14 (1)

A person who shall have been a Member of the Association for a period of 50 years shall not be required to pay

any annual subscription as from the 1st January next succeeding the expiration of such period or in the case of existing Members who have been Members for more than 50 years then as from the 1st January 1938 but so that this proviso shall be without prejudice in the case of a Member who is a Member of a Corporate Branch or of a Corporate Group to his obligations as such Member of the Corporate Branch or of the Corporate Group

Re-eligibility for Membership of the Association

46 Article 9 lays down the reasons for which membership of the Association may be terminated, and Article 7 gives the Council discretionary power regarding the re-election to membership of those whose former membership shall have been terminated by reason of conviction or expulsion as provided in Article 9 (c) (i) and (d). This power does not, however, extend to members whose membership ceases by reason of erasure from the *Medical Register* or forfeiture through misconduct of medical qualifications, as provided in Article 9 (c) (ii) (iii) and (iv).

The Council feels that this inconsistency should be remedied and recommends

Recommendation That Article 7 be amended as follows, and that the amendment be submitted to the necessary General Meeting of the Association

Page 10 Article 7, Lines 6-8

Substitute under Article 9 (c) or (d) "for by reason of his conviction or expulsion as hereinafter provided

The Article as amended would read

No person who shall have been a Member of the Association and ceased to be such shall be eligible for re-election until he shall have paid all arrears of subscription (if any) due from him to the Association at the date when his former membership ceased, and no person whose former membership shall have been terminated under Article 9 (c) or (d) shall, without the previous sanction of the Council, be eligible for re-election by any Branch

Subscription of Whole time Medical Members of Government Department Teaching Staffs

47 The Council has considered the question of the subscription payable to the Association by the whole-time medical instructors recently appointed by the Air Raid Precautions Department of the Home Office. The number of these officers is small, their duty is to conduct courses of instruction in anti gas measures for medical practitioners, nurses and medical students, and they are not permitted to engage in medical practice. The Council is of opinion that these practitioners should be considered on the same basis as whole time members of the teaching staffs of universities and medical schools and therefore eligible for a reduced subscription of two guineas and consequently that By law 14 (1) B (iii) should be amended accordingly. The Council recommends

Recommendation That By law 14 be amended as follows

Page 39 By law 14 (1), Schedule para B (iii), line 5. After school insert or Government Department. The paragraph would then read

Any Member who is not engaged in medical practice whether as consultant or otherwise and is a whole time member of the teaching staff of a university or medical school or Government Department and has signed and transmitted to the Treasurer a declaration to the foregoing effect in relation to the year for which the subscription is due. Two guineas

Representation of R N V R and Territorial Army on Naval and Military Committee

48 For the reason set out in para 135 of this report the Council recommends

Recommendation That the sixth column of the Schedule to the By laws relating to the Duties Powers, etc. of the Naval and Military Committee be amended by the addition

of the words 'the medical personnel of the Royal Naval Volunteer Reserve and the Royal Army Medical Corps (Territorial Army)'

Representation of Public Health Committee on Medico-Political Committee

49 Under the Schedule to the By-laws the Chairman of the Public Health Committee is ex-officio a member of the Medico Political Committee. It is desirable that the Public Health Committee should be allowed to nominate one of its members not necessarily its Chairman as a member of the Medico Political Committee, and the Council recommends

Recommendation That the Schedule to the By laws referring to the members, powers and duties of the Medico-Political Committee be amended by the deletion of the words 'The Chairman of the Public Health Committee' in the second column, and the insertion in the fifth column (otherwise appointed) of the words 'I to be appointed by the Public Health Committee'

Issue of "B M J" to Final year Students

50 Arrangements are being made by the Council for the supply of the *British Medical Journal* to senior medical students in Great Britain and Northern Ireland at a special annual subscription of 10s 6d. The issue will be limited to undergraduate medical students who have completed the second year of the clinical part of the curriculum subject to direct application and a written declaration by the student that he is eligible under the conditions laid down

Organisation of the Association

51 The Council reports an important development in connexion with the organisation of the Association in the Metropolitan area. For some time the Council has held the view that there is need in many areas for more active propagation of the Association's policy, and that it would probably be necessary in the near future to develop a system of regional secretarial organisation to implement and stimulate the medico political and other activities of the Association in the Divisions and Branches. The Metropolitan Counties Branch approached the Council and urged the appointment of a Medical Secretary for the Branch area. After careful consideration of the particular problem in London the Council decided to appoint for the London area a whole time regional medical secretary and organiser who, while working as a member of the headquarters staff, should devote his whole time to enhancing Association activities in that area.

Dr A K Gibson, one of the joint honorary secretaries of the Metropolitan Counties Branch, was appointed to the position.

In this connexion the Council has considered the following Minutes of the A R M 1936

Minute 22—Resolved That (with reference to para 30 of Annual Report of Council) the Council be instructed to consider and report on the steps necessary to secure better area organisation within the Association

Minute 38—Resolved That (with reference to para 171 of Supplementary Report of Council) owing to the special problems of medical practice in Wales, the Council be asked to consider the advisability of appointing a separate Secretary for Wales, with an office at a convenient centre in the Principality

The Council believes that the appointment of a Medical Secretary for the Metropolitan Counties Branch, the cost of which to the Association will, it is estimated be in the neighbourhood of £1 100 to £1,300 per annum will give general satisfaction to the members of the Branch and that the improved service will result in an increase of membership in that area. But in considering any extension of the arrangement there are various factors quite apart from the question of cost which must be borne in mind. The organisation of the Metropolitan Counties Branch presents features which are not necessarily present elsewhere, and the success

of the Association is so largely dependent upon the efforts of the honorary officers of its local units that it is essential that nothing should be done which would in any way disturb the position of these officers. After careful consideration of the whole question the Council feels that until practical experience of the Metropolitan Counties Branch experiment has been obtained it is not possible to express any useful opinion regarding the further extension of this method of organisation.

Apart, however, from any question of the extension of the Metropolitan Counties Branch arrangement the Council is of opinion that the time has arrived when an enquiry should be conducted into the peripheral organisation of the Association, with a view to strengthening it. A special committee has therefore been appointed to go into this question.

Medical Defence for Members Overseas

52 The Council is investigating the facilities available in respect of individual medical defence and financial indemnity for practitioners resident overseas.

"BRITISH MEDICAL JOURNAL"

53 The Council believes that the *British Medical Journal* during 1936 has kept its high position among the professional and scientific periodicals of the world. The close attention paid to its contents by members in all branches of practice, and not least by general practitioners, is reflected in the very large number of letters for publication that reach the Editor week by week. Heavy claims on the correspondence columns, and on other sections of the paper, led to a further increase in the total number of pages of letterpress. In the choice and presentation of material published in the *Journal* the aim has always been to supply members with a weekly periodical giving them a comprehensive review of progress in the science and practice of medicine, and a means for the exchange of opinion. The main function of the *Supplement* is to keep members informed of the course of the business of the Association and of the numerous directions in which it acts as the medico-political organisation of the profession. Much of this matter is of a kind that would not be published so fully in a journal conducted as a commercial undertaking, but further efforts have been made during the past year by co-operation between the Editorial and the Medical Departments to present such information in a more attractive form. The Council believes that this policy is approved by members, and that those engaged in medical work under the Insurance Acts value the prominence given in the *Supplement* to their interests and problems.

Typography of Journal

54 After more than two years' consideration by sub-committees acting under expert guidance, a complete scheme for reforming the typography and lay-out of the letterpress and title page and table of contents was carried into effect at the end of the year and the *British Medical Journal* with *Epitome* and *Supplement* came out in its new dress on January 2, 1937. An article describing and explaining the typographical changes was printed in that issue (p. 32) and the Council has put on record its appreciation of the advice given throughout all the preparatory stages by Mr. Stanley Morison. This reform in the outward appearance of the *Journal* has been widely welcomed by members at home and abroad; messages of congratulation still continue to reach headquarters and criticisms have been very few. Starting with the first issue of 1937 the *Journal* adopted the Harvard system of giving bibliographical references, and began the use of abbreviations of the names of scientific periodicals in accordance with the *World List*.

Special Series

55 The first group of thirty-five signed articles contributed to the *Journal* by invitation, on the Management of Major

Medical Disorders met with in General Practice was republished in book form in March, 1936, by Messrs. H. K. Lewis & Co. Ltd. under authority from the Council. This volume of 260 pages (price 8s. 6d.) was very favourably received and a second impression has now been called for. The second group of fifty articles was re-issued on November 18, 1936, by the same publishers, as a companion book of 426 pages entitled *Treatment in General Practice Vol. II* (price 10s. 6d.) and some 1,300 copies had been sold by the first week in March, 1937. Early in 1936 a collection of articles by Mr. D. Harcourt Kitchin, barrister-at-law, were reproduced from the Medico-Legal columns of the *Journal* in a book entitled *Legal Problems in Medical Practice* (Edward Arnold & Co., 10s. 6d.). The first of a series of signed articles on Endocrines in Theory and Practice, contributed by invitation, appeared in the *Journal* of October 17, 1936, and this feature has been continued weekly since that date. The Endocrinology series will be followed after an interval by a further series of weekly articles on Anaesthesia in General Practice. The possibility of supplying members with more up-to-date and reliable epidemiological news has been explored and it is hoped that this service will be started before long.

Some Figures for 1936

56 The average weekly number of pages in the *British Medical Journal* in 1936 was 136.8 distributed as follows:

<i>Journal and Epitome</i>	55.6
<i>Supplement</i>	13.9
Advertisements	67.3

The total number of pages of text and advertisements was 7,116 as compared with 6,752 in 1935, 6,396 in 1934 and 6,338 in 1933. These figures do not include the half-yearly indexes or special plates on art paper.

The Council appeals once again to members when sending communications to the Editor for publication to bear in mind the great variety of scientific and professional interests which rightly look to find representation in the pages of the *Journal*. In the year under review 966 addresses, papers and clinical memoranda were submitted, and of these it was possible to publish 513. An appeal has been made to contributors to summarise their articles and set out their conclusions in a terminal paragraph, while cross-headings are now inserted more freely throughout the pages in order that the reader, who cannot be expected to peruse the whole *Journal*, may grasp the gist of its principal contents. If further improvements in appearance and readability are to be achieved greater conciseness may be necessary, especially in correspondence. While it is desirable to encourage this section of the *Journal*, members are urged to make their points within the briefest compass.

Management of the Journal

57 At the November meeting of the Council the management of the *British Medical Journal*, the two special journals and all miscellaneous printings undertaken for the Association was put under the supervision of a Board of Directors elected for three years, each member receiving a remuneration of £5.5s. per meeting and under certain obligations as to attendance at meetings. The Board consists of R. G. Gordon (Chairman), R. J. A. Berry, J. C. Matthews, H. Robinson, R. Scott, Stevenson.

The Board has met on the following dates with full attendance on each occasion: November 20, 1936; December 4, 1936; December 18, 1936; January 22, 1937; February 19, 1937; March 12, 1937; and April 2, 1937. The officers of the Association receive all documents and attend all meetings but do not vote. Under the auspices of the Board the following action has been taken:

The *Journal* in its new present typography and cover appeared with the issue of January 2, 1937. Composition of the *Journal* ceased to be done in the printing office at B.M.A. House at the close of March, 1937, and this work with the machining and despatch was transferred to Messrs. Eyre & Spottiswoode, Ltd., with the number dated

April 3, 1937 This is in accordance with a five-year contract entered into between the Council and Messrs Eyre & Spottiswoode, Ltd, for composing, machining and despatch of the *Journal* after competitive tenders had been obtained from several firms and considered. The new printing arrangements involved the termination of the employment of some 29 employees of the Association, but all but four of these have found employment with the firms undertaking the work of the Association or elsewhere.

A contract for the supply of paper for the *Journal* for 33 months as from April 1, 1937, has been entered into with Messrs Townsend Hook & Son, Ltd on terms which are believed to be highly advantageous in view of the exceedingly rapid rise which is taking place and in the opinion of experts is likely to continue to take place, in the price of raw materials used for paper making. This was agreed upon after tenders from other firms able and willing to supply the type of paper required had been received and considered. A contract for miscellaneous printings required for the Association other than those which had appeared or would appear in the *Journal* has been entered into with Messrs Vacher & Sons, Ltd, who were adjudged the most suitable tenderer from among a large number of competing firms. The contract is from April 1, 1937, for five years. A contract has been entered into with Messrs William Clowes & Sons, Ltd, for the production of both special journals, the *Journal of Neurology and Psychopathology* as from July, 1937, and the *Archives of Disease in Childhood* as from March, 1938. In future these journals will have the same typography, the same size of page, will both appear quarterly and will cost 25s per annum to non members and 20s per annum to members of the B M A, single numbers to cost 7s 6d. This contract was also determined after a survey of a large number of tenders.

Arrangements have been made for the disposal of the machinery and equipment in the printing office on the fourth floor of the north-east wing of B M A House, and some of the resulting space will be used for a much-needed expansion of editorial accommodation, and the rest will be available for letting purposes. Canvassing for suitable advertisements has been actively pursued by the distribution of folders, a special booklet drawing attention to the new format of the *Journal*, as well as by personal visits and contacts. The Board has instituted a system of routine return of costing statements, lists of advertisements received etc., whereby a close check can be kept on the general financial status of the *Journal* and other publications of the Association.

Cost of Production and Distribution

58 The *Journal* account to be published next week in Abstract A of the Annual Financial Statement shows the gross cost of the production and distribution of the *British Medical Journal*, including all editorial and a portion of the managerial expenses. The figure was £75,637 in 1936, compared with £71,715 in 1935. It must not be forgotten, however, that the *Journal* account as set forth in the Financial Statement does not bear any proportion of the cost of construction or maintenance of the premises in which the *Journal* is produced nor does it allow for depreciation of the plant and type. The revenue from advertisements sales of *Journals*, reprints, reports, etc., amounted to £66,057, compared with £62,319 in 1935.

Censorship of Advertisements

59 While the acceptance of advertisements is not to be understood to imply a recommendation or guarantee and while no responsibility can be accepted with regard to the accuracy of the statements contained in advertisements a very strict censorship is maintained by the Journal Committee. The cash value of advertisements which, in pursuance of the Association's policy have been declined or discontinued represents a large sum but the policy of excluding undesirable advertisements from the official organ

of the Association is a duty which the Council feels it owes to the members of the medical profession. All new advertisements submitted for publication are scrutinised in the Finance or Medical Departments. Details of advertisements suspended or refused and of the grounds for the action taken are periodically reviewed by the Journal Committee.

"Archives of Disease in Childhood"

60 Early in 1926 the Council of the Association decided, in response to the wishes of many members interested in paediatrics to issue a periodical which would worthily represent the British school by recording the investigations and conclusions clinical and pathological, of all its workers. The first number of the *Archives of Disease in Childhood* appeared in February, 1926, and the eleventh volume was completed with the number dated December, 1936. The joint Editors are Dr Charles Harris and Dr Alan Monciffe and an Editorial Committee meets periodically, under the chairmanship of Dr G F Stull. The *Archives* has hitherto been issued six times a year, but with the next volume it will be issued quarterly. The subscription (post free) is 25s. (20s to members of the Association) payable to the Financial Secretary, British Medical Association, Tavistock Square, W C 1, subscription for Canada and the United States, 6 dollars (post free), price of single numbers, 7s 6d.

"Journal of Neurology and Psychopathology"

61 Since midsummer, 1926 the *Journal of Neurology and Psychopathology* has been issued by the British Medical Association, and the sixty-sixth number appeared in October, 1936. Its contents include original communications and editorial articles, together with abstracts of current neuropsychiatric literature, and critical reviews, and the scope and arrangement of this journal are such that it fills a place which no other published in English exactly occupies. The *Journal of Neurology and Psychopathology* is edited by Dr S A Kinnier Wilson, with the assistance of an Editorial Committee, and under his guidance it has established itself as one of the foremost periodicals for the record of progress in the branches of medicine with which it deals. Hitherto it has been published quarterly and the subscription of 30s. a year is payable to the Financial Secretary British Medical Association. The price of a single number is 8s 6d (post free). Under the new printing arrangement entered into with Messrs Clowes & Son certain alterations will have been made after the end of the present volume. The size of page will be larger and the cost 25s per annum (20s per annum to members of the British Medical Association), single numbers, 7s 6d post free.

SCIENCE

Scientific Sections at Annual Meeting, 1937

62 The following Sections will meet in connexion with the forthcoming Annual Meeting at Belfast

Three Day Sections—Medicine, Surgery, Obstetrics and Gynaecology, Pathology, Bacteriology and Immunology, Pharmacology and Therapeutics, including Anaesthetics,

Two Day Sections—Anatomy, Physiology, and Biochemistry, Diseases of Children, Neurology and Psychopathological Medicine, Nutrition, Ophthalmology, Orthopaedics including Treatment of Fractures, Otorhino-laryngology, Hygiene and Public Health, Radiology, Tuberculosis,

One Day Sections—Dermatology, Medical Sociology

The Association's Scholars and Grantees, 1936-37

63 During the year 1936-7 the Council allocated for the direct encouragement of original investigation and research £1,000, from which the following awards were made

Ernest Hart Memorial Scholarship (£200)

Kerr A S (Liverpool) M.B., Continuation of research into the functions of the diencephalon with special reference to its influence on gastric and intestinal motility and with reference to its part in the maintenance of body temperature. The method used involves the employment of the Souttar stereotaxic instrument.

Ordinary Research Scholarships (£150 each)

Archer Nora E. R. (London), 1 To investigate the clinical use of Protamine Insulin (a) a preliminary clinical assay of the various brands of Protamine Insulin and (b) an investigation of its therapeutic worth

2. To investigate the influence of salt deficiency on secretion of urine in cases of Diabetic Coma and other cases where salt deficiency occurs

Bingham D L C (Edinburgh), An investigation by clinical methods and animal experimentation into Fluid Balance and Salts Balance after operation or traumata of any kind

Lewis Beatrice (London), M.D., An investigation into skin diseases of known or suspected virus origin

(a) a preliminary study of the organisms found in impetigo with particular reference to the bacteriology of bullous eruptions of suspected virus origin

(b) study of the histology of the lesions

(c) demonstration of auto-infectivity of tissue extracts

(d) animal inoculations

(e) antigen-antibody reactions, complement fixation precipitation absorption reactions.

Travers, T & B (Melbourne), To continue an investigation into (1) the manner in which suppression of vision occurs in squint with a view to throwing more light on the development of amblyopia in squint (2) abnormal retinal correspondence in squint—with particular reference to the association of suppression of vision and abnormal correspondence

Owing to the resignation of the holder the Walter Dixon Memorial Scholarship has remained in abeyance during the present year

Work of Scholars and Grantees, 1935-36

64 Satisfactory reports have in all cases been received from the members of the Association who examined the work done by the scholars and grantees for 1935-36. Papers have been contributed by scholars and grantees to various scientific journals, and a synopsis of the work carried out was published in the *Supplement to the British Medical Journal* of August 22, 1936

The Library

65 The activities of the Library during the past year have increased in all departments and further increases may be expected as a result of the better service made possible by the additional £100 per annum granted by the Council in April

1936, for the purchase and supply of books. The number of readers has increased from 24 512 in 1935 to 25 226 in 1936 and the number of books borrowed from 16 227 to 16 819 during the same period. The arrangement for co-operation with other Libraries continues to be of great value, particularly in the case of the London School of Hygiene, the National Central Library and University College. Requests for literature on various specific subjects also continue to increase.

The Council acknowledges receipt during 1936 of 308 presentations of books, including calendars reports and society transactions.

Pending the establishment of a central library by the Irish Free State Medical Union (I M A and B M A) the Council has extended the facilities of the Association's Lending Library for a period of three years to members of that body, subject to certain conditions agreed to by the Union.

The Council regrets that a few members of the Association persistently disregard the Rules of the Library regarding the return of books. It has authorised the Science Committee at its discretion to suspend any such member from the privileges of the Library.

B M A Lectures

66 The system of B.M.A. Lectures under which each Division and Branch in England Scotland Wales and Northern Ireland may have one such lecture during the course of the year the expense being borne by the Central funds of the Association continues in popularity. The Council extends its cordial thanks to the following, who have given B.M.A. Lectures during the period April 1 1936 to March 31 1937: Mr A Lawrence Abel, Dr D K Adams, Dr J O W Bland, Professor F J Browne, Dr F G Chandler, Dr W S C Copeman, Professor F A E Crew, Dr H Crichton Miller (two), Dr D M Dunlop, Professor Daniel Dougal, Mr R C Elmslie, Dr William Evans (two), Mr A G Timbrell, Fisher, Mr D C L Fitzwilliam, Sir John Fraser, Dr A Rae Gilchrist, Professor John Glaister, Dr F Temple Grey, Dr H P Himsforth, Dr C M Hinds Howell, Mr J P Hosford, Mr R Watson Jones, Dr R D Lawrence, Mr R J McNeill, Love, Mr J B Macalpine, Mr G D F McFadden, Dame Louise Mellroy, Professor Sir Ewen Maclean, Mr D A Miller, Dr Reginald Miller, Dr W J O'Donovan, Dr J R K Paterson, Mr K Hampden Priddy, Dr Eric Pritchard, Dr W B Purchase, Mr Robert Richards, Dr Arnold Stott, Mr C Price Thomas, Dr H Letheby Tidy, Dr F M R Walsh, Sir William Willecox, Professor L. J. Witts, and Dr W G Wyllie.

Sir Charles Hastings Clinical Prize, 1937

67 The Sir Charles Hastings Clinical Prize, consisting of a certificate and cheque for 50 guineas which was established by the Council in 1924 for the promotion of systematic observation research and record in general practice has been awarded for the year 1937 to A Hamilton Harvie, M.B.N.Z., F.R.C.S. Ed., D.T.M. Calc., of Jagadhri, Punjab for his clinical study entitled 'Amoebiasis its Syndrome and other Clinical Features'. The essay which is the author's third contribution in competition for this prize contains much careful clinical observation among both European and Indian communities. Results are clearly presented the thesis is simply developed treatment and prevention are discussed and in the opinion of the adjudicators the essay is of a high order of merit. Special letters of commendation have been sent to the following: J A Moore, Hall M.B. Ch.B. Shotts Lanarks (The Blood Sedimentation Reaction in General Practice with special reference to Chronic Chest Diseases particularly amongst Coal-miners), L. S. Potter M.B. Ch.B. Buxton (Treatment of Infections by Intramuscular Injections of Whole Blood with special reference to the part played by Complement), and C L Potts, M.D. Redditch (A Study of the Value of Punctate Basophilia in the Control of Lead Hazards).

The Council has expressed its cordial thanks to Sir Humphry Rolleston and Professor F. R. Fraser, who examined the ten essays submitted for this prize

Katherine Bishop Harman Prize, 1938

63 The object of this Prize, which consists of a cheque for £75 and a certificate, is the encouragement of study and research directed to the diminution and avoidance of the risks to health and life which are apt to arise in pregnancy and child-bearing. It will next be awarded in 1938 for the best essay submitted in open competition, the competitor being free to select for presentation any subject falling within the object of the prize

Prohibition of Chemical Warfare

69 The Council has considered the following Minute 46 of the A R M, 1936

Minute 46 Resolved That this Meeting condemns unreservedly the use of poison gas in warfare as inhuman in its results and degrading to civilisation and relies upon the Council to do everything in its power with a view to securing the co-operation of the medical profession of all countries in order to prohibit the use of poison gas

Certain steps have already been taken in regard to chemical warfare. The League of Nations, by means of a protocol drawn up in 1925 and signed by 44 States, and through the Conference on the Reduction and Limitation of Armaments appointed by it, which reported in July, 1936, has expressed condemnation of the use of chemical, incendiary and bacterial methods of warfare, and of their preparation in time of peace.

The Netherlands Medical Association, through its Committee for War Prophylaxis has, since 1931, endeavoured to promote a campaign of international collaboration for War Prophylaxis of which the prohibition of poison gas in warfare has formed an important part.

In the hope of stimulating interest in this question, the Council has brought the opinion expressed in Minute 46 of the A R M, 1936, to the attention of the various national medical organisations and of the Association Professionnelle Internationale des Medecins

Anti-Gas Measures

70 The Council has had before it the following resolution passed at a meeting called by the Medical Peace Campaign on November 25, 1936

That this meeting asks the Council of the British Medical Association to consider instituting an enquiry, similar to the enquiry into nutrition, into the value of anti-chemical warfare measures

and is making enquiries of the Home Office regarding the general position

The Council has placed at the disposal of the Air Raid Precautions Department of the Home Office the local machinery of the Association in connexion with the scheme of that Department for the instruction of medical, veterinary and dental practitioners in anti gas measures. Sixteen whole-time medical instructors have been appointed by the Department, distributed at various centres throughout the country and responsible for the holding of courses of instruction in definitely prescribed areas. The arrangements for the courses are made in close collaboration with the local Honorary Secretary of the Association. To the end of March 1937, 4 782 practitioners 3 328 nurses and 754 students had been trained and the instruction is still continuing. The scheme has been received with great enthusiasm but owing to the limited number of instructors progress is necessarily somewhat slow. It is the ultimate intention to cover the whole of the country

Treatment and Cure of Leprosy

71 The Council has considered the following Minute 128 of the A R M 1936

Minute 128 Resolved That the following Motion be referred to the Council for consideration

121 Motion by Sheffield That the Representative Body desires to call attention to the advance that has been made in the treatment and cure of leprosy and the increased possibilities thus opened up for measures for the stamping out of this disease, and requests the Council to consider what steps, if any, the Association should take to assist in devising and promoting measures for its eradication

Various agencies are already engaged in leprosy work. The British Empire Leprosy Relief Association, established in 1923, is a very active voluntary body. One of its main interests is research, and it has organised and assisted financially leprosy work in many British possessions. It conducts active propaganda by means of lectures, films and literature embodying the latest advances in treatment, and publishes a quarterly bulletin and annual report dealing with its work in various parts of the world. Its chief need is for additional funds.

The League of Nations, through its Leprosy Commission, is also doing valuable work in connexion with leprosy. It does not undertake direct action in the matter of treatment or prophylaxis, but endeavours, by means of conferences of experts, to define the general principles of leprosy prophylaxis as ascertained by scientific research and practice. Under the auspices of the League a permanent central research centre has been established by the Brazilian Government at Rio de Janeiro. The centre is amply equipped, has an expert staff and abundant material available. It is accessible to experts of all countries, keeps in constant touch with international research, and through its pharmacological laboratory is able to supply at very reasonable terms to institutions which require them the chaulmoogra products for the treatment of the disease.

The Council is satisfied that, so far as the limited funds available permit, all possible steps are being taken for advancement of the treatment and cure of leprosy.

Remuneration of Medical Teachers, Laboratory and Research Workers

72 The scale of remuneration for non professional medical teachers, laboratory and research workers approved by the A R M in 1926 and 1929 presents considerable difficulty from the administration point of view. The Council is of opinion that the time has arrived when an attempt should be made to establish an agreed scale, and with this end in view representatives of the universities and other employing authorities are being invited to discuss the matter with representatives of the Association.

Proprietary Remedies

73 The possibility of action being taken to make available information regarding the composition and therapeutic activity of the various proprietary remedies advertised to the medical profession remains under consideration by the Council, in collaboration with the Pharmaceutical Society. Progress is necessarily slow, but trial investigations now being conducted into certain groups of preparations will, it is hoped, shortly be completed, when the Council will be in a position to proceed further with its consideration of this matter.

MEDICAL ETHICS

Labelling of Medicine Bottles

74 It has long been a statutory provision that a practitioner supplying a medicine containing a scheduled poison must include his name and address on the container. In view of the greatly extended list of scheduled poisons under the new Poisons Rules the Council has come to the conclusion that no exception can now be taken to the inclusion of the practitioner's name and address on the labels of all medicine bottles whether or not the ingredients therein include a scheduled poison. The Council advises practitioners to ensure that small lettering is used on the labels.

Cancer Investigation

75 Medical officers of health in various parts of the country are co-operating with the Ministry of Health in a

voluntary scheme with a view to obtaining the medical history of patients who have died from cancer, and are seeking to obtain information from practitioners on this subject. The Council sees no objection to practitioners completing the questionnaire on this subject, but the Council regards it as desirable that the questionnaire should be drafted so as to refer to the patient by means of an identification number and not by name, and that the practitioner should first approach the relatives of the deceased patients as to whether they have any objection to the information being supplied. (See also para 86)

Adoption by Divisions of Resolutions under their Ethical Rules

76 The Council has, during recent years, urged Divisions and Division-Branches to adopt under their ethical rules resolutions upon three items of Association policy. The present position in this matter is as follows:

Memorandum of recommendations as to salaries and conditions of service of whole time public health medical officers	Adopted by 101 Divisions
---	--------------------------

Provision of domiciliary attendance by consultants in private practice and not by whole-time medical officers	Adopted by 71 Divisions
---	-------------------------

Provision of domiciliary attendance upon public assistance patients by private practitioners and not by whole time medical officers	Adopted by 102 Divisions
---	--------------------------

The Council again draws the attention of those local units which have so far taken no action in this matter to the desirability in their own interests and those of the profession generally of adopting binding resolutions under their ethical rules in relation to the above questions.

Association Disciplinary Procedure

77 The Council has under consideration a suggestion that the initiative for expulsion of members who accept whole-time public health appointments under authorities which are not applying the Memorandum of Recommendations or appointments which are not in conformity with the Memorandum should be taken by a central Committee of the Association and not by the local units.

78 Representation was made to the Council under Article 10 as to the conduct of a member and after due inquiry by the Central Ethical Committee the Council in exercise of its powers, expelled the member from the Association.

Advertisements on Prescription Forms

79 The Council's attention has been drawn to the practice which is said to be growing among doctors of using prescription forms supplied by a firm of chemists the name of which is printed at the foot of the form. The Council has expressed the opinion that it is very undesirable that medical practitioners should use prescription forms which bear the name or the advertisement of any individual pharmacist or firm of pharmacists.

MEDICO-POLITICAL

Public Medical Services

80 During the past year there has been a steady increase in the development of Public Medical Services new services having been formed in the following areas: Ipswich, Dorset, Hull, Oxford and Peterhead. Consideration is being given to the formation of services at Bradford, West Norfolk, Leeds, East Somerset and Llandudno. The total number of Public Medical Services now in operation is 60.

The Council is continuing its efforts to co-ordinate this form of medical contract practice and in pursuance of this a further Conference of representatives of established Public Medical Services was held in November last. The

Conference was extremely well attended practically every Public Medical Service in the country being represented. It afforded an excellent opportunity for an exchange of views among those practitioners who are interested in this type of work. The remuneration paid to practitioners working under Public Medical Service arrangements has been reviewed by the Council and it appears that in the majority of cases, an adequate capitation fee is being paid for each person at risk. In those instances where the position is not satisfactory the Council has urged the Service in question to give the matter very serious consideration. The Council draws attention to the action recently taken by the Ipswich practitioners through the local Division of the Association which has led to the abolition of private medical clubs and Friendly Society contracts and the establishment through the formation of a Public Medical Service of unification of contract medical practice in the area. This has led to practitioners receiving a rate of remuneration considerably in advance of that previously paid by the local Friendly Societies for medical attendance upon their members, and to the public having free and open choice of doctor. The Friendly Societies now act as collectors for the Public Medical Service in addition, of course, to carrying out their ordinary functions.

The Annual Representative Meeting, 1936 empowered the Council to approve suitable forms of contract practice for persons with incomes above £250 per annum and acting under this authority the Council on the recommendation of the Metropolitan Counties Branch has approved an extension of the London Public Medical Service to persons with a total income up to £550 per annum. The rules of the extended scheme closely follow the model laid down by the Association for a Public Medical Service. They thus ensure (a) that the service will be under the complete control of its members (b) that membership is open to any registered medical practitioner in the area (c) that there is free choice of doctor by patient and of patient by doctor and (d) that there is provision for non-co-operating practitioners. The privileges of subscribers of the extended service include a general medical practitioner service with the supply of ordinary medicines, also (where desired by the subscriber) a complete examination annually.

Central Emergency Fund

81 This fund which is entirely supported by voluntary contributions, was created in 1906 with the object of where necessary, assisting members of the Association by grants which cannot be made from the funds of the Association to maintain the interests of the profession against organised bodies.

There is an urgent need for augmentation of the fund and the Council strongly commends it to the support of members.

National Deposit Friendly Society

82 The Council has previously expressed its concern at the reduction in the scale of medical charges paid by the National Deposit Friendly Society but it is now glad to report that, as a result of representations the Society has agreed to modify its scale and to bring it into line with the Association's suggestions.

Dental Benefit Regulations

83 The Annual Representative Meeting, 1936 (Min. 113) expressed strong condemnation of the Dental Benefit Regulations (1936) as the result of which Approved Societies have power to withhold dental benefit from their members if the fee of the practitioner who has administered the anaesthetic exceeds that allowed under the Regulations and the Council has carefully considered this situation. The profession was not consulted before the Regulations came into force and the Association was informed upon enquiry that the scale would be in no way binding on medical practitioners. Certain of the fees payable for the admini- tra-

tion of anaesthetics are below those recognised by the Association for work of this character

The Council suggested to the Ministry of Health that insured persons should be allowed to pay any difference between the fee payable by the Approved Society under the scale and the fee charged by a medical anaesthetist, and informed the Ministry of the decision of the Representative Body concerning the fees for such services. The view expressed by the Ministry after consulting the Dental Benefit Council was that under the Regulations a satisfactory service of dental treatment for insured persons could be secured, and that while the Regulations were not binding on medical practitioners there was no reason for granting to them a higher fee than that payable to dentists. In view of this unsatisfactory position the Council raised the whole question with the Dental Benefit Council, the statutory body charged with the duty of administering the Regulations. The Dental Benefit Council was unable to accept the suggestion advanced by the Association that an insured person engaging his own practitioner as anaesthetist should be allowed to pay any excess over the scale fees to meet the practitioner's charge, while retaining his title to grant from the Approved Society on the basis of the normal scale fees, as, in its view such a form of "contracting out" would be contrary to the spirit of the Regulations and would, if permitted, constitute a grave danger.

Upon the question of the fee payable for the service, however, the Dental Benefit Council stated that it was reviewing the financial effect of the Regulations and that it was prepared to consider further representations from the Association upon this point provided that they did not involve any extension of the principle of "contracting out."

The policy of the Association is that for the simple administration of nitrous oxide, or a similar anaesthetic, there should be a minimum fee of 10s 6d, that if more than one patient is dealt with at the same time and place the fee should be 7s 6d per patient, and that for other administrations, whatever the anaesthetic, the fee should be £1 1s.

The present Regulations allow for the payment of fees on a sliding scale according to the number of teeth extracted, but in respect of two items of service the fees are below the Association's minimum. Although the Council holds the view that the period of anaesthesia required and the responsibility incurred by the anaesthetist are not necessarily dependent upon the number of teeth extracted, it realises that there are certain advantages in the sliding scale method drawn up by the Dental Benefit Council. It must be assured however, that the Association's minimum fee is adhered to. The Council has therefore made representations to the Dental Benefit Council that para 4 (b) of the second schedule be amended to read

(b) Administration of General Anaesthetics in connexion with the extraction of—	Fee per case in
One to eight teeth	10s 6d
Nine to twelve teeth	12s 6d
Thirteen to sixteen teeth	17s 6d
Seventeen or more teeth	£1 1s. 0d.

Mortuary Facilities

84 The Council has considered the following Minutes 98 and 99 of the A R M 1936

Minute 98—Proposed That the British Medical Association demand provision of public mortuaries in country areas for the reception of dead bodies and for the proper conduct of post mortem examinations

Minute 99—Resolved That the motion be referred to the Council for consideration

and has obtained information on the subject from the Divisions and Branches in rural areas. It is evident from this information that the mortuary facilities, including proper arrangements for the conduct of post-mortem examinations in many parts of the country are either entirely lacking or totally inadequate.

The Council is approaching the Ministry of Health on these subjects and the Council will urge the Minister to take

appropriate action with the local authorities concerned, and to use, where necessary the powers recently conferred upon him by Section 198 of the Public Health Act 1936, which will come into operation in October next

Payment of Civilian Practitioners for Attendance on Members of Defence Forces Fees for Examination of Recruits for Territorial Army

85 The following are the fees at present paid to civilian medical practitioners for attendance upon members of defence forces

Consultation at Surgery	2s 6d
Visit by practitioner	3s 3d
Night Visit	4s 6d

With increased allowances for mileage

The Council has always regarded these fees as being inadequate and has from time to time made representations thereon to the Departments concerned, but without success. The Council is again pursuing the matter with the Admiralty, the War Office, and the Air Ministry, and is urging that the fees should be increased.

The fee at present paid for examination of recruits for the Territorial Army is 2s per recruit. Some years ago the Council endeavoured to secure an increase in this fee, but, at the request of the Divisions concerned the matter was allowed to drop. The Council feels that it is an opportune moment to press for an increase in this fee, and representations are accordingly being made to the War Office (and if necessary to the Territorial Associations) that the fee should be increased to a minimum of 5s.

Investigation of Deaths from Cancer

86 Inquiry has been made of the Council as to whether those practitioners who furnish information to medical officers of health in connexion with the investigation of deaths from cancer should receive a fee for completing the questionnaire and, if so, by whom the fee should be paid. The Council is (1) informing the Ministry of Health that a fee should be paid to the practitioner completing this report and (2) suggesting to the Ministry that the medical officer of health before approaching the practitioner in these cases should first ascertain from the relatives if they have any objection to such information being supplied by the practitioner. (See also para 75.)

Medical Referees to Friendly Societies

87 The Council has considered the following motion passed by the annual meeting of the Scottish Association of Friendly and Approved Societies in June last

That the Executive consider the advisability of setting up a Panel of Medical Referees so that Friendly Societies may be in a position to have members who are not insured for national health purposes examined at reasonable fees

After some little discussion it was unanimously agreed that the Association approve the principle of setting up a panel of Medical Referees for Friendly Societies and that it be remitted to the Executive to make the necessary arrangements,

and has approved the principle of setting up a panel of medical referees of Friendly Societies for the examination of those of their members who are not insured. In the opinion of the Council such a panel should be open to practitioners of considerable experience in general practice

Licensing Regulations Governing Electrical Treatment

88 The Chartered Society of Massage and Medical Gymnastics proposes to approach the L C C with an application that the following treatments should be placed in the same category as ultra violet ray treatment, diathermy, galvanism, faradism, high frequency sinusoidal current and x ray, and should be given only under medical direction and is desirous of obtaining the Association's support in this application. The Council has informed the Society that the Association will be prepared to support the application.

Duties of and Ethical Rules for Industrial Medical Officers

89 The Birmingham Central Division represented to the Council its concern at the tendency for industrial medical officers to encroach upon the work of private practitioners and the Council came to the conclusion that in view of the steadily increasing number of practitioners now employed by industrial firms on a whole time or part-time basis, it was desirable that the Association should attempt to define the relationship of such officers to the general practitioner. The Council has prepared rules outlining the duties and governing the ethical conduct and relationships of industrial medical officers, and these are embodied in Appendix IV of this report.

The Council draws attention to the following points

(i) The schedule of duties (Part I) is comprehensive, but every industrial medical officer would not necessarily be required to undertake all these duties.

(ii) The intention of Part II of the rules is to define the scope of the treatment which should be given by the industrial medical officer and to promote his co-operation with the worker's own medical attendant. At present there are considerable variations in the matter of treatment given at the works-clinic and there is frequently no co-operation between the industrial medical officer and general practitioner. It is proposed that the industrial medical officer shall not undertake domiciliary treatment and that except in the special circumstances indicated in Rule I (iv) he shall only give emergency or first aid treatment at the factory or workshop.

(iii) Rule I (xiv) and (xv) deals with the medical records kept by the industrial medical officer and the maintenance of professional secrecy. This is a matter of considerable importance.

(iv) In order to maintain the independent position of the certifying surgeon under the Factory Acts the Council suggests that it is desirable to stipulate that the industrial medical officer shall not hold the position of certifying factory surgeon in the same area as that in which the factory concerned is situated (Rule 4).

The Council recommends

Recommendation. That the statement of the duties of Industrial Medical Officers and the ethical rules relating to such officers be approved. (See Appendix IV)

Representation of Medical Profession on Local Authorities

90 The Council has considered the following Minute 103 of the A R M 1936

Resolved. That the Representative Body, believing it to be of the utmost importance that medical practitioners should seek election to local authorities, urges Divisions (a) to encourage members of the Association to interest themselves in local politics and to offer themselves as candidates through the recognised machinery of the area, (b) to maintain the closest contact with the medical members of the local authorities and continually to keep them informed of the views of the Division on matters before local authorities,

and is taking the following action

(1) At the following times in each year Divisions and Branches will be urged to act on the lines suggested in para (2) of Minute 103

In June in respect of the local authority elections taking place in the following November

In November in respect of the County Council and other local authority elections taking place in the following March and

(2) Divisions and Branches will be informed of the following statement outlining the more important ways and means in which the local profession may help when a medical practitioner has in fact secured election to a local authority (whether with the help of a Division or not)

(i) Steps should be taken to establish and maintain the closest contact with him. It may be feasible to elect or co-opt him to the Executive Committee of the Division or to the Branch Council. In any case the Branch Council or Executive Committee should itself or through a special Subcommittee assume responsibility for maintaining a liaison with such a practitioner or practitioners and for keeping him informed of the views of the Association generally and of the Division on matters under consideration by the local authority. The local authority member for his part should keep this Committee informed of possible future developments of his authority's work.

(ii) The Division should consider where necessary what arrangements can be made to help the member of the local authority in his practice, thus enabling him to attend meetings of committees and of the Council without fear of prejudicing his practice.

Nursing Problems

91 The Council has considered a communication from the College of Nursing inviting the views of the Association upon a number of important nursing questions. The Council has prepared a comprehensive report on the questions raised which it has submitted to the College of Nursing.

The Council hopes to publish this report, which is of considerable interest to members of the Association, in an early issue of the *Supplement*.

Though the question of the scope of the examination papers of the General Nursing Council was not one of those submitted to the Association by the College of Nursing, the Council felt that it had a bearing on several of the issues discussed. The Council is aware that the General Nursing Council has decided that the education of the State Registered Nurse must reach a high standard in both theoretical and practical subjects but it finds it difficult to understand why it should be necessary or indeed advisable for nurses to acquire the special knowledge needed to enable them to answer some of these questions which relate to diagnosis and medical treatment as distinct from nursing care of certain diseases, some of them of a rare nature.

The Council is further of opinion that the inclusion of such questions must of necessity lead a candidate to spend valuable time in the study of matters that are not in fact the business of a nurse which might be employed more profitably in learning the essential principles of nursing. It also considers that the inappropriate nature of such questions may be a possible cause of the difficulty experienced in securing a sufficient supply of State Registered Nurses. The Council has so informed the General Nursing Council and the College of Nursing.

Emergency Treatment under Road Traffic Act

92 The Council again reminds members that it has prepared for their use model forms for making claims for emergency treatment rendered under the Road Traffic Act.

Application for these forms should be made to the Medical Secretary. There is no charge.

Information to Insurance Companies

93 The Council has communicated to the Life Offices Association the following Minute 87 of the Annual Representative Meeting 1936

Minute 87—Resolved. That where any medical certificate is required by an insurance company in the case of a deceased patient not previously examined for life insurance, such certificate should not be furnished without the previous consent of the nearest available competent relative and that a fee of not less than 10s 6d should be paid by the insurance companies for any such certificate.

and has been informed in reply that when an insurance office makes direct application to a medical practitioner for a certificate on the lines indicated in above-quoted Minute 87, it should pay the practitioner's fee. The Life Offices Association has informed its members of the fee suggested by the Association for such certificates.

Select Committee on Medicine Stamp Duties

94 The Council submits in Appendix III a Memorandum of Evidence given on behalf of the Association before the Select Committee on Medicine Stamp Duties.

Medical Officers of Ministry of Labour Training Centres

95 The Ministry of Labour has been considering the establishment in the special areas of a new class of local training centre for unemployed men and one of the functions of

the centres will be to provide medical, dental, and optical treatment for such of the men attending the centre as are in need of it

The Council has forwarded for the consideration of the Ministry of Labour a statement of duties of the medical officers of these centres and has made suggestions as to the fees which should be payable for this work. In the statement of duties the Council has suggested, *inter alia*

(a) that where as the result of his examination the Centre doctor forms the conclusion that the trainee needs medical attention before he can profit by the facilities provided at the Centre, he shall refer the trainee to his own practitioner or (if the trainee cannot obtain medical attendance by private or insurance arrangements) to the District Medical Officer

(b) that the Centre doctor shall give emergency and first-aid treatment where required, but shall refer the trainee for further treatment if necessary in accordance with (a) above, and

(c) that the Centre doctor shall conduct such periodical examinations as may be necessary of persons undergoing training, and shall certify as to their capacity and fitness for work, and advise as to transfer or training in other parts of the country

Fees to Post Office Medical Officers

96 As the fee for a medical examination and report in workman's compensation cases is ordinarily one guinea, the Council suggested to the Postmaster General that a similar fee (in place of the fee of 10s.) should be paid in those cases where a member of the public was involved in an accident in which the Post Office was concerned, and upon which an examination and report was made by a Post Office medical officer. The Postmaster-General has agreed to raise the fee to 15s

Workman's Compensation and Accident Cases

97 The Council has considered the following Mins 94 and 95 of the Annual Representative Meeting, 1936

Minute 94—Resolved That with reference to para. 87 of Annual Report of Council a medical man, when called upon to visit and report on a workman's compensation and accident case should not report upon such a case without first meeting in consultation the usual medical attendant of the patient, and that the latter should be paid a fee of not less than one guinea by the insurance company for his attendance at such a consultation

Minute 95—Resolved That the Motion be referred to the Council for consideration

It appears to the Council that the Association's rules for Medical Inspectors deal adequately with the first point raised in Min 94. Concerning the second point, the legal position appears to be that the employer cannot be required to pay a fee for the attendance of the workman's doctor if the latter attends the examination, and that the workman has no absolute right to have his doctor present at an examination, although in many instances it is not unreasonable and in some it is definitely desirable that he should be present. In view of this position and the fact that a number of insurance companies at present invite the attendance of the workman's own practitioner and pay a fee for such attendance the Council does not propose to take any action in respect of Min 94

Administration of Drugs by Members of Nursing Profession

98 The Council has expressed general approval of the following resolution adopted by the Association of Hospital Matrons

That no Nurse, trained or in training should administer dangerous drugs or medicines containing dangerous drugs on verbal orders only but that all such orders should be prescribed in writing by a qualified Medical Practitioner and further, that the attention of Hospital Authorities of the College of Nursing and of the British Medical Association be called to the risks involved in the carrying out of verbal instructions of which no proof can be obtained

Factory Legislation

99 The Council has made representations to the Home Secretary upon a number of health questions arising from the new Factory Bill which is at present before the House of Commons. In particular, the Council has (i) suggested modifications in the hours of work, as to the weights which should be lifted by women and young persons employed in factories, and as to cleansing and ventilating of factories, (ii) urged that pregnant women should not be employed in factories during the last six or eight weeks of pregnancy, (iii) urged that shuttle kissing should be abolished

In view of the revision of factory legislation the Council is of opinion that the Association should press for a substantial increase in the fees paid to certifying factory surgeons. These are at present

For an examination at the works 1s for each person examined (minimum fee 2s 6d) and mileage at the rate of 6d for each complete half-mile over and above the mile

For an examination away from the works, 1s for each person examined

For an examination which involves special report, 5s

These fees have long been held to be inadequate and the Council recommends

Recommendation That the remuneration of certifying factory surgeons should be increased as follows

(i) for a complete examination in each case and for certification of young persons under the Factory Acts, a fee of 7s 6d per case, and

(ii) for special examination and report on Form 190, Form 500, or Form 1830, a fee of £1 1s, subject to a reduction where a number of cases are reported upon at the same time

Appointment of Coroners under the L.C.C.

100 The Public Control Committee of the L.C.C. made a proposal in July last that, in view of the recommendation of the Departmental Committee on Coroners' Law, in future only solicitors or barristers should be appointed as coroners, and the L.C.C. should discontinue the requirement of dual qualification (*i.e.* medical and legal) for these appointments. The proposal was however, withdrawn as a result of the action of the medical members of the L.C.C., and a deputation from the Association has since been received by the Public Control Committee. The deputation urged that no steps should be taken by the L.C.C. to alter its present by law relating to the appointment of coroners until the Government had considered the report of the Departmental Committee and had announced its policy in regard to the Committee's recommendations. The decision of the L.C.C. in this matter has not yet been announced

Principles Governing Contract Practice Arrangements

101 As a result of information obtained through the Divisions and Branches the Council has made a survey of contract arrangements in England and Wales and consideration of this matter has led the Council to the conclusion that the time has arrived for some revision and extension of the Association's policy which at present is expressed in the following Minutes of the A.R.M.

Minute 109—Resolved That the Representative Body adopt the following principles as essential to the formation of any schemes for the provision of medical attendance and treatment of uninsured persons

(i) That in general in considering the necessity for obtaining the approval of the Council for schemes for the treatment of uninsured persons upon contract terms the following principles and conditions must be adhered to

(a) Free choice of doctor by patient and of patient by doctor

(b) Remuneration to be not less than that which is deemed by the Council to be equivalent to that paid in respect of insured persons

(c) Persons with a total income from all sources of £250 per annum or upwards or the dependants of any such person not to be treated under contract terms

(2) That the Representative Body realises that the circumstances of some areas justify a modification of the above conditions and in such circumstances the approval of the Council may be given provisionally to a scheme involving other payments, or different income limits when the local profession can show that the circumstances in the area demand it

(3) That one of the conditions necessary for the approval of schemes containing lower rates of payments shall be the inclusion amongst the rules in a prominent position of a statement that approval by the Association has been given to the rates only because of special economic conditions

The Council considers it to be desirable that a standard content of medical service should be defined as an ideal to be aimed at in all contract work and that for this purpose the content indicated in the Association's Model Scheme for Public Medical Service is desirable. This provides that a subscriber to a Public Medical Service so long as his subscriptions are not in arrears shall be entitled to receive from his medical attendant

(i) Medical and surgical treatment which general practitioners as a class may be reasonably expected to provide in the area concerned at the surgery of his medical attendant or dispensary of the Service within the hours mentioned on his card or when his condition requires it at his place of dwelling

(ii) All ordinary medicines * and dressings for such wounds and other injuries as are treated by the medical attendant

but that the subscriber by virtue of his payments to a Public Medical Service shall not be entitled to

(i) Medical service in respect of any of the following matters

(a) Confinements (that is to say attendance in labour resulting in the issue of a living child or attendance within ten days after labour in respect of any condition resulting therefrom)

(b) Vaccinations

(c) Administration of a general anaesthetic

(d) Certificates and reports (at the discretion of the area concerned)

(ii) Medical attendance in respect of

(a) Operations requiring general anaesthetics

(b) Operative dentistry

(iii) Bottles and other containers

(i) Examinations court attendances etc., under Common Law and Workmen's Compensation Employers' Liability, and other statutes

(i) Attendance beyond a mile radius from the house of the medical attendant

The Council also suggests that wherever practicable, forms of contract practice should be replaced or should be conducted through a public medical service or an organisation similarly constituted

The Council recommends

Recommendation (1) That it is desirable in all contract practice arrangements that the content of medical service to be provided should be that laid down by the Association in its Public Medical Scheme

(2) that wherever practicable private clubs should be replaced by Public Medical Services

(3) that if and when practicable works and colliery contract arrangements should be replaced by an organisation such as a Public Medical Service

(4) that in the case of adult and juvenile members of friendly societies the arrangements for the provision of medical service provided by these societies should be through a Public Medical Service or similarly constituted organisation

102 The Council is also of opinion that the profession should definitely decide that there should be no differentiation in the contract rates for medical attendance upon the

* Where such are available under the service

juveniles or adults. Some local units of the Association are now acting upon Min 95 of the A R M 1928 which permits Divisions and Branches to make local arrangements for the treatment of juvenile Oddfellows at the rate of 8s 8d per annum

The Council recommends

Recommendation That there should be no differentiation in the contract rates for medical attendance upon juveniles and adults and that the following minute of the A R M, 1928 be rescinded

Minute 95—That the Representative Body approve a standard rate of 8s 8d per head per year including drugs for the remuneration of medical practitioners for medical attendance and medicine for juvenile members of the Manchester Unity of the Independent Order of Oddfellows that the Council be authorised to approve a slightly lower rate than 8s 8d per head per year for a time to be definitely stated for application in any area in which it is satisfied that owing to economic conditions the standard rate of payment is not feasible and that it be an essential part of this arrangement that there must be free choice of doctor by patient and of patient by doctor

PUBLIC HEALTH

Remuneration of Medical Practitioners Employed Part-time by Local Authorities

103 The Council has considered the following Minute 119 of the A R M 1936

'Minute 119 Resolved That the following amendment be approved in principle it being referred to the Council to decide the form of words to be used in incorporating it in the Association's policy

79 Amendment by Cardiff That the first paragraph of Section 2 (a) Regular Sessions be amended by the insertion of on an average before 1 regular attendance and of an average of before 2 hours duration, and that Section 2 (b) Individual Sessional Fees be amended by the insertion of on an average before 2 hours duration

Section 2, to which the amendment by Cardiff refers reads as follows

(2) *Consultant and Specialist Work at Hospitals or Clinics*

For consultant and specialist work at hospitals or clinics (including the administration of anaesthetics treatment of venereal disease and x ray examination and treatment) remuneration on the following scale

Regular Sessions

(a) Where the method of payment is by salary then

	Not less than £
Where not more than 1 regular attendance or session per week is required or not more than 2 hours duration	125 p.a.
Where 2 regular attendances or sessions per week are required	200 p.a.
Where 3 regular attendances or sessions per week are required	275 p.a.
Where 4 regular attendances or sessions per week are required	350 p.a.
Where 5 regular attendances or sessions per week are required	425 p.a.
Where 6 regular attendances or sessions per week are required	500 p.a.

Individual Sessional Fees

(b) Where an individual additional or occasional consultative or specialist session of not more than two hours duration is required, the remuneration should be not less than £2 12s 6d per session

Emergencies

(c) If emergency attendances are required the fee should bear suitable relation to the ordinary fees of the area for the service given and should be arranged after consultation with the local profession

Mileage

(d) In every case an augmentation of salary or a suitable payment for mileage should be arranged except when the practitioner's residence or consulting room is within two miles of the institution where the attendance or services are rendered

Holidays

(e) Consultants employed at an annual salary should be allowed a reasonable annual holiday for which period of absence

from duty locumtenents should be provided at the expense of the local authority

The Council has inserted the following note in the Association's policy on this subject

The annual salary for an appointment under this scale which involves some variability in the weekly number of attendances should be based on the estimated average number of weekly attendances during a year. The arrangement of sessions should provide for reasonable uniformity of duration.

Midwives Act, 1936

104 On September 18 1936 the Ministry of Health issued a circular (No 1569) to local supervising authorities, drawing attention to the provisions of the Midwives Act, 1936 and urging the immediate formulation of schemes for establishing a service of salaried midwives so that as required by the Act, these might be submitted to the Ministry not later than January 30 1937 and be brought into operation not later than July 30, 1937. Every authority before submitting proposals to the Ministry was statutorily required to consult "such local organisation, if any, of registered medical practitioners as appears to the authority effectively to represent the opinion of such practitioners practising in that area on the question to be considered in formulating the proposals." The Council has advised Divisions and Branches as to the action to be taken by them for the purpose of consultation with local supervising authorities. Emphasis was laid upon the following points—(a) the necessity of securing arrangements which will enable the patient to have as free a choice of midwife as possible and to exercise that choice privately by direct communication with the midwife rather than through an officer of the authority, (b) nomination by the patient of the practitioner of her own choice to be called in by the midwife should medical assistance be necessary, (c) the desirability of the remuneration of midwives not being so standardised as to prevent individual skill judgment and personality from reaping due reward. Divisions and Branches were also requested to use every available opportunity of urging that local maternity services should be established in accordance with the Association's policy for a National Maternity Service.

In a number of cases attention has also been drawn to (a) the desirability of the provision of an adequacy not only of midwives qua midwives but also of midwives qua maternity nurses and (b) the necessity of separate scales of assessment for patients' contributions in respect of the services of (i) midwives, (ii) maternity nurses based on the assumption that a woman who books a doctor and midwife acting as maternity nurse is less able to pay than a woman of the same economic status who contents herself by booking a midwife only.

The Council is glad to note that many local units have taken appropriate steps on the lines indicated and from such information as is available it appears that the Association's policy has received a fair amount of recognition by local authorities. The consultations which have taken place have provided opportunities for closer co-operation between the general practitioner and the public health officers of local authorities. In a few instances where the local supervising authority failed to consult representatives of the profession as required by the Act representations have been made to the Ministry requesting that the schemes submitted by the local authorities concerned should be returned with an instruction that the statutory consultations should take place.

Ministry of Health Circular 1550 on Children under School Age

105 This Circular issued in May, 1936 appeared to imply that the success of maternity and child welfare work was primarily dependent upon an efficient health visiting service. The Circular urged that children under school age should be visited at regular intervals by a health visitor who should only refer them to a medical practitioner if she has grounds for suspecting disease or defect. This proposal appeared to the Council to overlook the medical practitioner as a primary factor in the prevention of illness and disease. The Council has called the attention of the Ministry of Health to this

matter, emphasising the desirability of regular supervision of infants and young children by a medical practitioner in order that progress may be noted and the mother advised as to the measures to be adopted for the maintenance of the health of the child.

Fees for Medical Practitioners called in by Midwives

106 A deputation from the Association has discussed with representatives of the Ministry of Health the scale of fees for doctors called in by midwives under the Midwives Acts, which was approved by Min 32 of the A.R.M., 1936. Following this discussion the scale adopted by the Representative Body has been reconsidered by the Council and certain amendments have been made. On October 26, 1936 the Minister, in pursuance of his powers under Sub-section (1) of Section 9 of the Midwives Act, 1936, issued the Medical Practitioners (Fees) Regulations, 1936 prescribing conditions governing the payment of such fees. It will be recalled that the conditions set out in the previous scale of fees had been declared ultra vires following the judgment given in the Court of Appeal in the case of Brown and Others v. Monmouthshire County Council. The Council has approved the following scale of fees, which has been transmitted to the Ministry with a memorandum embodying the reasons which have led the Association to suggest modifications of the scale approved by the A.R.M., 1936. For purposes of comparison the Association's revised scale is set out side by side with the scale now in operation under the 1936 Regulations, the variations being indicated in italics.

Scale of Fees prescribed by the Ministry of Health

- 1 Fee for all attendances of a medical practitioner at parturition (that is, from the commencement of labour until the child is born) whether operative assistance or not is involved including all subsequent visits during the first 10 days inclusive of the day of birth £2 2 0
- 2 Fee for attendance of a second medical practitioner to give an anaesthetic whether on account of abortion or miscarriage, at parturition or subsequently £1 1 0
- 3 Fee for suturing the perineum, for the removal of adherent or retained placenta for exploration of the uterus for the treatment of post partum haemorrhage or for any operative emergency arising directly from parturition including all subsequent necessary visits during the first ten days inclusive of the day of birth £1 1 0

This fee not to be payable when the fee under (1) is payable

- 4 Fee for attendance at or in connexion with an abortion or miscarriage, including all subsequent visits during the ten days from and including the first visit £1 1 0
- 5 Fee for visits to mother and/or child not included under (1) to (4)
Day (9 a.m. to 8 p.m.) 5s
Night (8 p.m. to 9 a.m.) 10s

Scale of Fees approved by Association

- 1 Fee for all attendances of a doctor at any time from the commencement of labour until the child is born whether or not operative assistance is involved in including all subsequent visits during the lying in period as defined in the Rules of the Central Midwives Board £3 3 0
- 2 Fee for attendance of a second doctor to give an anaesthetic, whether on account of abortion or miscarriage at parturition or subsequently £1 1 0
- 3 Fee for suturing the perineum for the removal of adherent or retained placenta for exploration of the uterus for the treatment of post partum haemorrhage, or for any operative emergency arising directly from parturition including all subsequent necessary visits during the lying in period as defined in the Rules of the Central Midwives Board £1 11 6

This fee not to be payable when the fee under (1) is payable

- 4 Fee for attendance at or in connexion with an abortion or miscarriage including all subsequent visits during the fourteen days from and including the first visit £2 2 0
- 5 Fee for visits to mother or child not included under (1) to (4)
Day (9 a.m. to 8 p.m.) 5s
Night (8 p.m. to 9 a.m.) 10s

- 6 The usual mileage fee of the district to be paid for all attendances under (1) to (5) of this scale
- 7 Fee for attendance on mother and/or child at the medical practitioner's residence or surgery 2s 6d
- 8 The conditions subject to which fees are to be payable to medical practitioners under the said subsection are
- (a) The medical practitioner shall not have agreed to attend the patient under arrangement made by or on behalf of the patient or by any Club, Medical Institute or other Association of which the patient or her husband is a member
- (b) The medical practitioner shall not be under obligation to give the treatment to the patient under the National Health Insurance Acts, 1924 to 1935
- (c) The medical practitioner shall not receive or agree to receive a fee from the patient or her representative
- (d) Fees shall not be payable (i) in respect of any services performed by the medical practitioner later than the tenth day after his first attendance, except where he has reported to the local supervising authority that he considers for reasons stated that his further attendance is necessary (ii) in respect of any services performed by the medical practitioner after the expiry of four weeks from the birth
- 6 The usual mileage fee of the district to be paid for all attendances under (1) to (5) of this scale
- 7 Fee for attendance on mother or child at the doctor's residence or surgery—not included in (4) 3s 6d Where this attendance includes a complete ante natal examination the fee shall be 5s
- 8 The conditions subject to which fees are to be payable to medical practitioners under the *Midwives Acts 1902-36* are
- (a) The medical practitioner shall not have agreed to attend the patient under arrangement made by or on behalf of the patient or by any Club Medical Institute or other Association of which the patient or her husband is a member
- (b) The medical practitioner shall not be under obligation to give treatment to the patient under the National Health Insurance Acts, 1924 to 1935
- (c) The medical practitioner shall not receive or agree to receive a fee from the patient or her representative
- (d) Fees shall not be payable (i) in respect of any services performed by the medical practitioner later than the *fourteenth* day after his first attendance, except where he has reported to the local supervising authority that he considers, for reasons stated that his further attendance is necessary (ii) in respect of any services performed by the medical practitioner after the expiry of four weeks from the birth

A further point of importance has been raised with the Ministry in connexion with Section (a) of the conditions subject to which these fees are payable. It will be agreed that it is desirable that the midwife on booking her patient should ascertain the name of the patient's doctor whom it is desired should be called in should subsequent events render this necessary. It is equally desirable that the doctor should intimate his willingness to attend if sent for in the proper way. The Association has asked the Minister for a ruling as to whether either or both of these steps would if taken, preclude the doctor from remuneration under the Regulations and has urged the Minister, if necessary, appropriately to amend the conditions so as not to preclude an arrangement or arrangements which are certainly in the interests of the mother.

Recommendation That the action taken by the Council in connexion with the scale of fees for medical practitioners called in by midwives be approved

Local Government Officers' Superannuation

107 In the speech from the Throne the King in opening Parliament on November 3, 1936 stated that legislation would be submitted to make further provision for the superannuation of local government officers. In the House of Commons on November 16 Mr Hudson (Parliamentary Secretary to the Ministry of Health) stated that the main object of the Bill would be to secure provision by all local

authorities for the superannuation of their administrative professional and clerical staff, in order to remove the bar to mobility to which the absence of a uniform superannuation system gives rise.

A deputation from the Association discussed the proposed Bill with representatives of the Ministry of Health on December 11, 1936, and stressed, *inter alia*, the following resolutions of the Association

(a) That all medical officers employed by local authorities should be entitled to added years of service not exceeding 10—with the consent of the Ministry of Health for the purpose of superannuation allowance

(b) That the superannuation schemes of local authorities should be uniform that the total service of a medical officer with local authorities should rank for computation of superannuation allowance and that provision should be made for interchangeability of superannuation of medical officers as between voluntary and council hospitals

Administration by Unqualified Persons of Light Treatment in Welfare Centres

108 The Chartered Society of Massage and Medical Gymnastics has enquired as to what extent the Association would be willing to co-operate with the Society in approaching the Ministry of Health with a view to the uniform adoption of a recommendation that only persons holding the Society's light and electrotherapy certificate should be regarded as qualified to give light treatment. The Council has informed the Chartered Society that it is of opinion that except where light treatment is given under medical supervision, only persons presenting evidence of adequate training and experience in the administration of light treatments should be employed for that purpose.

Shellfish and Public Health

109 A copy of the following resolution of the A R M 1936 was sent to the Ministry of Health

The time has now arrived when the Ministry of Health should be requested to make regulations prohibiting the sale for human consumption in this country of molluscan shellfish whether home produced or imported which are not certified to have been cleansed by the recognised method at a station approved for the purpose by the Ministry of Health

Salaries of Public Dental Officers

110 The British Dental Association has asked for the Association's assistance in connexion with the preparation of a scale of salaries for various grades of public dental officers on the lines of the Memorandum of Recommendations as to salaries of whole time public health medical officers. The Council has informed the British Dental Association that it will be glad to advise that body in the light of the experience gained in the application of the Memorandum of Recommendations

Milk (Special Designations) Order, 1936

111 A copy of the following resolution of the A R M 1936 has been forwarded to the Ministry of Health

That only milk complying with the conditions required for the designations Tuberculin Tested or Pasteurised or preferably both, can safely be consumed without boiling

The Council has considered and approved a scale of fees for the testing of designated milk in accordance with the requirements of the Milk (Special Designations) Order 1936. It recommends

Recommendation That the following scale of fees be adopted for the testing of designated milk in accordance with the requirements of the Milk (Special Designations) Order 1936

1 Tuberculin-tested milk and accredited milk	
Methylene blue Test	3s. 6d. singly or for batches of six or more
Coliform Test	2s. 6d. singly or for batches of six or more (3 tubes).
For contract work for public health authorities	3s. per sample

2. Tuberculin test of pasteurised milk, and pasteurised milk
 Phosphatase Test 7s. 6d. singly or
 6s. for batches of six or more
 Bacterial count 3s. singly or
 3s. for batches of six or more

Note—It should be understood that the Ministry of Health does not demand that every sample of milk shall be subjected to both the methylene-blue and the coliform tests. It is sufficient if the coliform test is applied to a proportion of samples.

Memorandum of Recommendations as to Salaries of Whole-time Public Health Medical Officers

112 The Association again acknowledges with gratitude the continued co-operation of the Society of Medical Officers of Health and of the proprietors of the *Lancet* and the *Medical Officer* in rejecting advertisements from authorities which have not applied the Memorandum of Recommendation scales to their whole time public health medical officers. The Advisory Committee set up under Section X of the Memorandum, has dealt with a number of cases during the year.

The attitude of local authorities to the Memorandum of Recommendations is in the main satisfactory and there are now few important authorities not applying this agreement.

Scottish Scale of Salaries for Whole-time Public Health Appointments

113 The Scottish scale of salaries for whole-time public health appointments which varies in some respects from the Memorandum of Recommendations as to the salaries of whole-time public health medical officers in England, Wales, and Northern Ireland, was first approved by the Representative Body in 1927 to operate for one year, and in 1928 its operation was extended for a further five years, since when its operation has been extended annually or biennially. The Council recommends

Recommendation That the Scottish scale of salaries for whole-time public health appointments be continued in operation for a further year.

Form of Report by Medical Practitioners under Ante-natal Schemes

114 The Council is proceeding with the preparation of a model form of report for completion by general practitioners in connexion with the examination of expectant mothers under ante natal schemes adopted by local authorities.

Maternity Services in Northern Ireland

115 The Ministry of Home Affairs for Northern Ireland has appointed a committee under the chairmanship of Professor Johnstone to examine the conditions under which the organisation of maternity services is carried on in Northern Ireland and to recommend such alterations in the existing system as may be desirable for securing adequate nursing and medical services for domiciliary maternity cases and improved efficiency in the services in general. The committee has been supplied with copies of the Association's memoranda and publications in relation to maternity services and has been informed of the Association's willingness to co-operate in every way and if necessary to give evidence before the committee.

Ascertainment of Mentally Defective Children

116 The Council has considered a recommendation of the National Union of Teachers that in all examinations for the ascertainment of mentally defective children provision should be made for the attendance of and consultation with the head teacher concerned. The National Union of Teachers has been informed that the Association while desirous of encouraging full co-operation between teachers and medical officers of health regards this suggestion as impracticable.

Diagnosis of Syphilis

117 The Council has considered a resolution passed by the Association of Clinical Pathologists that in view of the

importance of identifying syphilitic infection in pregnant women a blood Wassermann reaction should be carried out as early as possible as a routine test on all women attending ante natal clinics. The Association of Clinical Pathologists has been informed that the Council is not in favour of this recommendation.

NATIONAL HEALTH INSURANCE

Insurance Capitation Fee

118 For several years there has been a growing feeling that the capitation fee of 9s. awarded by a Court of Enquiry in 1924 has become inadequate for the services which an insurance practitioner is called upon to give to an insured person. During the past twelve years there has been a substantial increase in the volume of work and in the content of the service. The 1936 Annual Conference of Local Medical and Panel Committees instructed the Insurance Acts Committee to proceed in the matter and, when the preparation of the case to be submitted on behalf of insurance practitioners had reached an advanced stage, a formal application was submitted to the Ministry of Health. The Minister himself then met a deputation from the Committee. He intimated that, in his view, a flat rate substantially below the present figure could well be justified. At the same time he agreed that, both sides holding opposite views the question was one which could best be settled by arbitration and he undertook to make the necessary arrangements. It is understood that the arbitrators will be asked to say what in their opinion is the appropriate fee for medical attendance on all sections of the insured population, including those insured workers under 16 years of age shortly to be brought into National Health Insurance as the result of legislation promised by the Government.

Extension of Medical Benefit to Insured Workers under 16

119 In the original programme of legislation for the current parliamentary session mention was made of a measure to provide for employed juveniles between school leaving age and 16 years of age being brought within the scope of medical benefit under the National Health Insurance Acts. In the autumn of last year discussions were opened with the Ministry of Health in regard to the capitation fee to be paid to medical practitioners for this new group of insured persons. It was understood that the persons affected would be those males and females who had left school and entered insurable occupations, approximately one million at the outset and that the medical benefit to which they would be entitled would be identical to that available to other insured persons except that in the absence of sickness benefit, insurance practitioners would not be required to issue certificates of incapacity. The Ministry expressed the view that there was justification for a capitation fee lower than 9s. on the grounds that medical certificates would not be required and that the demand on the services of medical practitioners would be less than in respect of the existing insured population.

The Ministry was informed that there was no ground for differentiation of the standard capitation fee on account of the incidence of sickness amongst the new class of insured persons that any variation was opposed to the principle of insurance upon which National Health Insurance was based and that whilst certificates might not be required for National Health Insurance purposes some form of certification of incapacity would be necessary in practice thus making it desirable that certification should be included in the contract of the medical practitioner.

Eventually the Minister of Health made an official offer of a capitation fee of 7s. 6d. In making this offer he did not press the contention that persons within the new age group were likely to make fewer demands on the services of practitioners than persons of older ages but he maintained that the absence of the requirement to issue certificates of incapacity would result in a considerable reduction in the

time occupied in giving those certificates, including special visits by the insured person for that purpose

At a Special Conference of Local Medical and Panel Committees called for January 7, 1937 the following resolutions were passed unanimously, and subsequently transmitted to the Ministry of Health

That the offer of the Minister of Health of a capitation fee of 7s 6d for medical attendance on insured persons under 16 years of age be rejected

That this Conference recommends insurance practitioners to decline service for the provision of medical benefit for insured workers under 16 years of age at the terms offered by the Minister of Health

That in view of the inadequacy of the existing capitation fee and pending the result of negotiations for its increase, this Conference is not prepared to accept for attendance on insured workers under 16 years of age a capitation fee less than that which is paid for adult insured workers

That the Insurance Acts Committee be authorised to take action in the light of the decisions reached by the Conference.

There has been no further communication from the Ministry upon this matter but the position now is that the question will be settled by arbitration as part of the general question of the standard capitation fee

Fees for Domiciliary Attendance on Dependants of Insured Persons

120 In the Report of the Departmental Committee on Scottish Health Services it is suggested that 6s would be an appropriate fee for domiciliary attendance on the dependants of insured persons. The Annual Conference of Local Medical and Panel Committees expressed the opinion that such a fee is inadequate

OPHTHALMIC

National Eye Service

121 The National Eye Service, which is the popular name for the NOTB scheme, continues to make steady progress throughout the country. In 1936 no less than 23 per cent more cases were dealt with than in 1935. It is particularly gratifying to note that there was an increase of 41 per cent in the number of insured persons who exercised the right given them by statutory regulations to take their benefit through the Service rather than submit to an examination by a sight testing optician in accordance with their societies' instructions. Nevertheless, there is still ample room for expansion. The success of the scheme is very largely dependent upon the support given to it by the medical profession and the Council appeals to those who come in contact with the people for whom it is intended to make it more widely known. An explanatory circular was issued to every general practitioner in October last and a further copy will gladly be sent to anyone who may have mislaid it.

The Annual Representative Meeting last year (Minute 166) expressed the view that evening sessions attended by the ophthalmic surgeons concerned would greatly increase the success of the Service, and the Council will do its best to effect arrangements on the lines suggested in any area which desires to have evening sessions.

For the third successive year a number of ophthalmic surgeons have voluntarily kept statistics of the eye conditions of patients referred to them through the Service, and the following analyses of the three series of 10 000 cases show a remarkable consistency in the percentage of patients who require medical attention for conditions other than errors of refraction

	1934	1935	1936
	per cent.	per cent.	per cent.
Cases of error of refraction only	64.09	64.22	65.39
Cases of error of refraction plus one or more other eye conditions	29.15	27.88	25.83
Cases without an error of refraction but with one or more other eye conditions	5.75	7.36	7.93
Cases with no appreciable eye defect	1.00	0.54	0.85

These figures prove, if proof is needed, the advisability of recommending an ophthalmic medical examination in every case of suspected eye trouble

Ophthalmic Benefit New Regulations

122. In 1930, for the first time the Minister of Health made regulations governing the administration of additional benefits under the National Health Insurance Act. The Regulations gave a member the right to obtain ophthalmic benefit otherwise than in accordance with the arrangements made by his society for the general body of its members. This provision, which the Association had long advocated, enabled a member who wished to have an ophthalmic medical examination, but whose society favoured a sight-testing optician's examination to make use of the National Eye Service without forfeiting any part of the normal grant made by the society.

The 1930 Regulations further provided for (1) the adoption of a scale of charges for the supply of optical appliances of a standard quality which scale was to include as a separate item, any service rendered by an optician incidental to the provision of an appliance and (2) with certain exceptions, an optical appliance being obtained from any optician belonging to an organisation of opticians for the time being recognised by the society. The status of the optician was therefore a matter within the sole discretion of each society.

In December 1934 a body known as the Ophthalmic Benefit Joint Committee, consisting of representatives of groups of approved societies and optical organisations, issued a report which urged the desirability of statutory recognition being given to sight-testing opticians and the appointment of a statutory body on the lines of the Dental Benefit Council, to be charged with the responsibility of administering ophthalmic benefit, including the right to decide which opticians should be employed in connexion with that benefit. When the report of this committee was issued the Association at once took steps to acquaint the then Minister of Health through his advisors, of the undesirability of affording official recognition to the practice of sight-testing by persons other than qualified medical practitioners. A promise was given that the views put forward on behalf of the Association would receive careful consideration in the event of any action being taken arising out of the Ophthalmic Benefit Joint Committee's report.

Nothing more was heard until October 1936 when it was learned that the Minister proposed to provide by regulation for the establishment of a committee whose duties would include (1) the establishment of a register of opticians in connexion with Ophthalmic Benefit and (2) the compilation of a scale of charges for the supply of optical appliances. The Minister received a deputation on November 12 which consisted of the President of the Association, members of the Committee the Vice-Chancellor of London University and representatives of the Royal Colleges and the more important ophthalmological societies. The Minister said that he fully agreed that where any person had reason to think there was anything wrong with his eyes his best course undoubtedly was to be examined by a medically qualified eye specialist and he was in agreement with any action the Association might take to educate the public to this point of view. He undertook that in the Amending Regulations the proposed list of opticians should be expressly referred to as a list of opticians recognized for the purpose of supplying glasses to insured persons, and no more. Of no less importance however was the Minister's promise to give careful consideration to the possibility of excluding from the Amending Regulations any reference to an item in the scale of charges for optical appliances of a service rendered by an optician incidental to the provision of an appliance. A reference in the Regulations to such a service would imply official recognition by the Minister of sight testing by an approved optician.

When the draft amending regulation subsequently appeared there was nothing in it which gave official recognition,

explicit or implied to sight-testing by an optician. In other words, the official recognition which the Minister proposes to give to opticians approved by the Committee set up by him applies only to their ability as expert craftsmen. To do otherwise would create an undesirable precedent since there has not so far appeared in any Act of Parliament or Regulations anything signifying official approval of sight-testing by unregistered persons.

The Amending Regulation is still in "Draft" form, and it is understood that the Minister has been pressed to vary the provision relating to the compilation of a scale of charges so as to secure the re-inclusion of a reference to 'a service rendered by an optician incidental to the provision of an appliance'. Members of Parliament have also been urged by sight-testing opticians in their constituencies to give their support, when the amending regulation becomes substantive and is laid on the table of the House to the restoration of this provision. The Council hopes that the Minister will decline to put into the Regulation any form of words which will imply recognition of sight-testing by opticians.

HOSPITALS

Future Development of Council Hospitals

123 The Council has reviewed the question of the possible development of Council Hospitals under the Local Government Act, 1929 and has had the advantage of receiving a memorandum on this subject by the Medical Superintendents Society. The memorandum contained valuable suggestions regarding the type of hospital which should be developed, its staffing and the carrying out of the general and maternity work. After consideration of the whole question the Council came to the conclusion that there was no need at present to vary that section of the Hospital Policy relating to Council Hospitals.

Liabilities of Local Authorities in Respect of Institutions Maintained by Them

124 The judgment given in the House of Lords in the case of *Lindsey C.C. v. Marshall* raised important questions affecting hospitals, local authorities and the medical profession and the Council has given careful consideration to the issues arising. It will be recalled that this was a case in which the Court of Appeal awarded £750 damages against the Lindsey C.C. for its negligence in allowing a patient who was being treated in a nursing-home under its jurisdiction to contract puerperal fever. The County Council contended it was not liable for any negligence on the part of its medical staff in a matter of professional care or skill which it was not competent to supervise or regulate, but the Court found unanimously that the County Council was responsible for the error of its medical officers and matron in not warning the patient that there was infection in the home and that it was dangerous. The Council extended an invitation to the British Hospitals Association, the County Councils Association and the Association of Municipal Corporations to join in a conference to consider the implications involved. The joint conference decided to obtain the opinion of Counsel upon the important questions raised by the judgment of the House of Lords and the Council hopes to be in a position to deal further with this matter in its Supplementary Report.

Voluntary Hospitals (Paying Patients) Act, 1936

125 The Charity Commissioners have now drawn up draft Rules under Section 5 (1) of the above Act relating to applications by hospitals for Orders authorising the provision of pay-bed accommodation. The Council is satisfied that there is nothing in the Rules to which objection need be taken.

Central Co-ordinating Body of Provident Associations

126 During recent years the Council has taken an active interest in the development of Provident Associations which

have for their object the provision of institutional treatment for middle-class persons and it will be recalled that in 1934 the Representative Body approved a scheme outlining the principles on which such associations should be established. During the session under review the Council convened a conference of provident associations and other interested bodies, as a result of which it was decided to form a co-ordinating body to be known as the National Federation of Provident Associations. The Council has given financial assistance in connection with the preliminary expenses necessary to the formation of such a body, on condition that repayment will be made by the permanent co-ordinating body as soon as funds are available.

Consultants List for London

127 Some four years ago the Council decided to establish for the area of the King Edward Hospital Fund for London a list of practitioners willing to provide consultant and specialist services at a modified fee to persons entitled to medical benefit under the National Health Insurance Acts contributors to the Hospital Savings Association subscribers to approved Public Medical Services, and to others of a like economic status as guaranteed by membership of a recognised organisation. Experience of the working of this list has shown that it has meant the payment of a modified consultation fee by a number of persons who would otherwise have obtained gratuitous hospital services, and that the use which is being made of the list is gradually increasing. It is felt that when the facilities provided under the list are more widely known amongst that class of the population for which the list was established it will be used to a much greater extent.

The Council has given careful consideration to a suggestion that the area covered by the list should be varied and has had regard to the representations made. The Council has decided to vary the area of the list to an area corresponding with that of the Metropolitan Police Area.

The Council also considered a suggestion that the value of the list would be improved if detailed charges were made for x-ray examinations, but came to the conclusion that it would be undesirable to include in the Consultants List any such detailed schedule. The Council agreed, however, that the question raised could be met by modifying the fee payable for the service so as to allow in the case of radiologists a fee of £1 1s (plus the cost of material in all radiological cases).

A Model Contributory Scheme

128 The Council's attention has been drawn to the model contributory scheme prepared by the British Hospitals Contributory Schemes Association as this model differed in certain important respects from the principles laid down by the Association regarding the formation of contributory schemes. The Council has made representations on the matter to the British Hospitals Contributory Schemes Association.

Pay-beds and Private Practice

129 The Council has considered the position of honorary directors of radiotherapy departments in voluntary hospitals where there is a whole-time assistant radiological staff. There is an increasing tendency to appoint whole-time radiologists and it appears that in a number of instances paying patients are referred to the whole-time assistant radiological staff rather than to the honorary director of the radiological department. In many cases such patients would ordinarily have been dealt with by the honorary director in the course of his private practice.

The Council is of opinion that in voluntary hospitals where the radiotherapy department is staffed by an honorary director assisted by whole-time assistant radiologists the honorary director should have the opportunity of attending the patients in private wards and that in cases where he personally undertakes treatment he should receive not less than two-thirds of the fee payable by the patient the remainder of the fee being allocated towards hospital costs.

In cases where the honorary director decides not to undertake such work personally but retains responsibility for the report issued the fees should be a matter for arrangement between the honorary director and the hospital in relation to the extent of the radiological services rendered by the honorary director

Insurance Schemes for Members of Honorary Medical Staffs of Hospitals

130 The Council has considered a suggestion from the United Kingdom Temperance and General Provident Institution for Mutual Life Assurance that the principle of endowment assurances by hospitals on the lives of members of honorary medical staffs should be generally applied throughout the country the assurance so effected enabling hospitals to make a gift of the policy monies to each individual on reaching the normal retiring age. A similar proposal was considered by the Council in June 1935 when no objection was offered to the arrangement provided it is clearly stated in the scheme that such an insurance scheme is not accepted as a substitute for payment of the medical staff of the hospital. The Council has replied accordingly to the United Kingdom Temperance and General Provident Institution for Mutual Life Assurance

NAVAL AND MILITARY

Terms for Recruitment for Officers of I M S

131 The Council has drawn the attention of the India Office to the anomalous position whereunder an Indian candidate for the I M S is required to show that at the date of birth his father was a British subject domiciled in India or a subject of a State of India. This requirement appeared to render ineligible for entry into the Service any Indian candidate whose father though formerly a British subject domiciled in India, had come to reside in this country previous to the birth of the candidate and it was suggested to the India Office that the mere fact of non retention of the Indian domicile should not be allowed to constitute a bar to eligibility for the Service. The Secretary of State for India agreed that this anomaly might arise under the existing rule and stated that consideration would be given to the revision of the rules in this respect. Any cases arising in the meantime will be considered on their merits for exception from the existing rule

Developments in the Indian Medical Service

132 The Council has considered the new rates of pay and terms for recruitment in the Indian Medical Service. These new rates show a greater discrimination between the pay of European and Indian officers. This is caused by a reduction—ranging from 50 to 150 rupees per month—in the basic rate of pay and an increase in the amount of over-seas pay. Thus while the position of European officers remains practically unchanged the new rates represent an appreciable lowering of the pay of the Indian personnel of the Service.

A communication has been sent to the India Office expressing regret that it has been found necessary to reduce the basic rate of pay and to increase the over seas rate of pay, and inquiring the reasons which have been advanced for the increased differentiation in the rates of pay for European and Indian officers of the Indian Medical Service

Rates of Pay of Retired Officers Re-employed in the Defence Forces

133 The Council has made representations to the Admiralty the War Office and the Air Ministry in accordance with Minute 168 of the Annual Representative Meeting, 1936

Minute 168—Resolved That the retired pay of medical officers of the defence forces should be regarded as deferred pay and should not be taken into consideration in determining the pay of those medical officers on voluntary re-employment by the defence departments

The Departments have replied that it is a general custom in determining the remuneration payable on the re-employment of all retired officers to take into consideration the retired pay which the officer is receiving and that no departure from this general principle could be contemplated in the case of medical men

Remuneration of Part-time Civilian Medical Practitioners Employed by Air Ministry

134 The Council represented to the Air Ministry that the fees payable to civilian medical practitioners attending regular and reserve personnel under training at Civil Flying Schools were inadequate and compared unfavourably with the rates paid to practitioners employed on a sessional basis by other departments or by local authorities. Representations were accordingly made to the Air Ministry, and the Council is pleased to be able to report that the Ministry has intimated that the amendments shown below to the paragraph in question have been approved and that steps are being taken to have all the relevant contracts amended

Original Scale	Suggested Amendment	Air Ministry's Decision
(ii) For attending a medical board a fee of 10s 6d for each attendance up to a maximum fee of £1 1s for any one sitting	10s 6d per case or £1 1s per session provided that not more than 4 cases are dealt with at one time	Accepted
(iii) For a special medical examination after an accident, when the pilot is apparently uninjured in order to certify whether there is any injury to the base of the skull, concussion of the brain, or other injury likely to interfere with the officer's or airman pilot's future career, a fee of 10s 6d per examination with a maximum of £1 1s should the personnel involved be any number more than one	10s 6d for each examination or £2 12s 6d for a session of not more than 8 cases	Accepted
(iv) For the annual medical examination of officers (Classes 'A' and 'A A') and airman pilots of the R A F Reserve and for such occasional medical examinations of pupil pilots which may be necessary before training can commence at a fee of 5s per examination together with mileage at 1s a mile for each visit where the examination is carried out at the Flying School	9s 6d for each case up to a maximum of £2 7s 6d for the first 8 cases and 9s 6d for each case beyond 8 per diem together with mileage allowance of 1s a mile (in one direction) for each visit where the examination is carried out at a Flying School not under one mile away	

Representation of Medical Personnel of Territorial Army and Royal Naval Volunteer Reserve on Committee

135 The Council considers that provision should be made to secure the co-option to the Naval and Military Committee of representatives of the Royal Army Medical Corps Territorial Army and the medical personnel of the Royal Naval Volunteer Reserve. A recommendation to this effect is embodied in para 48 of this Report

Representation of R.A.F. Medical Service on the Council

136 The term of office of Wing Commander H M Stanley Turner, the representative on the Council of the

Royal Air Force Medical Service expires at the termination of the Annual Representative Meeting, 1937. The Council recommends

Recommendation That Air Commodore Hardy V Wells be elected to represent the Royal Air Force Medical Service on the Council for the period 1937-40

CONSULTANTS AND SPECIALISTS

Provision of Consultant and Specialist Services at a Modified Fee

137 The question of the provision of consultant and specialist services at a modified fee to persons of defined income limits was considered by each annual regional meeting of the Consultants and Specialists Group. For the most part regional meetings expressed opposition to the extension to their areas of the London consultants list arrangements although they did not oppose the inclusion of consultative services in the National Health Insurance service. The Council has recorded the view that it favours the principle of the extension of the National Health Insurance Acts benefit to include consultant and specialist services, provided the conditions are satisfactory to the members participating therein such conditions to include a fee of not less than one guinea for a consultation at the rooms of the consultant or specialist involving such examination as can be given at a single consultation, together with a report when necessary, for the information of the private practitioner.

Constitution of Group

138 At the request of the Nottingham Division the Council has amended the scheme adopted for Specialists and Consultants Groups by dividing the existing Region 5, consisting of Sheffield, Rotherham, Doncaster, and the Counties of Derby, Nottingham, Rutland and Lincoln into two new Regions

- (i) Consisting of Sheffield, Rotherham, Doncaster, and Rutland, and
 - (ii) Consisting of Derby, Nottingham and Lincoln,
- each Region to elect one member of the Group Committee

OVERSEA BRANCHES

Conference of Oversea Members

139 A conference of oversea members will be held during the Annual Meeting, 1937, at Belfast, and all oversea members who are present at the Meeting are invited to attend. The Council will welcome any suggestion from Oversea Branches or Divisions for subjects for discussion.

Promotion in the Colonial Medical Service

140 The Council reported last year (Supplementary Report, para 198) that dissatisfaction had been caused in the Colonial Medical Service by the promotion to a senior post of an officer whose length of continuous service was relatively short in preference to a considerable number of Senior Medical Officers and Deputy or Assistant Directors of Medical Services of greater length of service. Representations on the subject were accordingly addressed to the Secretary of State for the Colonies. He has replied that in the selection of the officer concerned full account was taken of the experience and general capabilities of other members of the Colonial Medical Service who were considered with him for the appointment and that his decision was based on the fundamental principle that, for any vacant post that candidate should be selected whose appointment the Secretary of State judged in all the circumstances of the particular case to be in the best interests of the public service. This reply has been sent for observations to the Branches which raised the matter.

Deputation to the Colonial Office

141 A number of important questions affecting the Colonial Medical Service have arisen during the year, and the Council appointed a deputation, consisting of the Chairman of the Dominions Committee (Dr W Paterson), the Deputy Chairman (Dr J L Gilks), Colonel A H Proctor, and the Deputy Medical Secretary, to seek an interview with representatives of the Colonial Office. The Colonial Office expressed its willingness to receive the deputation, and on January 6, 1937, a discussion took place at the Colonial Office with Sir George Tomlinson, Assistant Under-Secretary, Sir Thomas Stanton, Chief Medical Adviser and other representatives of the Colonial Office. The subjects discussed were

- 1 Conditions of service for medical officers in West Africa
- 2 Medical practice in Hong Kong
- 3 Tonga Medical Service
- 4 Windward Islands Medical Service
- 5 Restoration of temporary deductions from salaries
- 6 Ante dating of appointments in the Colonial Medical Service
- 7 Short service appointments in the Colonial Medical Service

For the purpose of assisting on the subject of the Hong Kong Medical Service, Dr J C Macgown, who has recently returned from Hong Kong, accompanied the deputation.

European Medical Officers in West Africa

142 The Council reported last year (Annual Report, para 145 and Supplementary Report, para 196) that members of the Colonial Medical Service serving in West Africa were dissatisfied with the recently revised scale of salaries and that they had addressed a memorial to the Secretary of State for the Colonies. The principal causes of dissatisfaction were

- 1 The grading of a Senior Specialist below a Senior Resident
- 2 The excessive reduction of the salaries of Assistant Directors of Medical and Health Services and Junior Specialists
- 3 The inadequate maximum salary for Medical Officers
- 4 The alteration of salary scales and prospects of promotion from those which medical officers were offered when entering the service

The medical officers in Nigeria were of the opinion that the operation of the new scale would reduce their status in the West African Colonial Service, and that the future of the Service would be jeopardised if entrants could not depend upon the maintenance of the salary scales and the prospects of promotion which they were offered when accepting appointment. In consequence of the memorial, certain revisions have been made in the new scale, including the increase of a Senior Specialist's salary from £1,400 to £1,500 but these amendments have not removed the grievances of the medical officers.

The views of the medical officers were supported by the deputation to the Colonial Office mentioned above in para 141, and the deputation submitted that the rights of medical officers in relation to prospects of promotion should be preserved. The representatives of the Colonial Office replied that it was not suggested that the medical officers in West Africa had no claim to fair prospects of promotion. The reductions effected in higher establishments of Government Departments in the Colonies in recent years had necessarily been governed by considerations of finance. The Secretary of State's advisers, however, were of opinion that an increase in the number of senior medical posts open to the medical staffs in West Africa was justifiable, and it was proposed to examine the question of effecting an improvement in this respect when the observations of the Governor of Nigeria were received.

The representatives of the Colonial Office maintained that the salaries of senior medical officers could not be con-

sidered in relation to the salaries of political posts only, or to salaries in Nigeria only. In rapidly developing countries, political or economic changes were apt to affect the responsibilities of senior administrative officers more quickly and more directly than those of officers in the medical and other branches of the Government service.

The representatives of the Colonial Office promised, however, that the situation to which the deputation had drawn attention should be further reviewed, and that the question of making some adjustments in the salaries of the appointments which they had mentioned should be carefully considered in the light of the discussion.

The report of the discussion has been sent to the medical officers concerned in Nigeria for their comments.

Medical Practice in Hong Kong

143 The Council has been asked by the Hong Kong Branch for its assistance in preventing encroachment by the Government on private practice. It will be remembered that in 1927 the Council was instrumental in obtaining from the Hong Kong Government a promise to the profession that fees would be charged both for the maintenance and for the treatment of persons admitted to Government hospitals. In practice, however, the promise was not fulfilled, because no scheme for collecting the fees was arranged.

The question of encroachment has now been revived in a more acute form, for the Government is adopting responsibility for the maintenance of a medical service for the whole community, and is proposing to provide institutional treatment not only for those persons who are unable to pay, but also for those who can afford to pay reasonable charges. Persons in the latter class are charged fees for maintenance and treatment in public hospitals which bear no relation to the charges which they would have to pay in private nursing homes. The result is that the private practitioner and the private nursing home, which can provide fully for the normal requirements of that part of the population able to pay reasonable charges are being driven out of business.

The representatives of the Colonial Office stated that, so far as could be ascertained, there was nothing on record in recent correspondence received by the Secretary of State from the Governor of Hong Kong which suggested that there had been any change of policy in the matter on the part of the local Government or that any encroachment on private practice by the Government medical service, such as was mentioned by the deputation, had occurred.

It was finally arranged that the Association should ask the Branch again to submit representations to the Governor with a request that, if the Governor should feel unable to meet them, he would forward the correspondence, together with his observations thereon, to the Secretary of State. The Branch has accordingly been asked to take this action.

Tonga Medical Service

144. A practitioner who has recently vacated the appointment of Chief Medical Officer in the Tonga Islands Medical Service has reported the deplorable conditions which exist in the Dependency for the administration of the medical service. The information he gave was submitted to the Colonial Office by the deputation. The representatives of the Colonial Office pointed out that the relationship between the British and the Tongan Governments was such that the Secretary of State could bring pressure to bear on the Tonga Government only to a limited extent, but they promised that the Colonial Office should consider whether any action could usefully be taken, and that the deputation's suggestion that Tonga might be brought within the scope of a Western Pacific Medical Service should not be lost sight of.

Windward Islands Medical Service

145 The deputation asked the representatives of the Colonial Office to what extent the recommendations made by Dr Kelly, a member of the Colonial Advisory Medical Committee in his report on the medical service in the Wind-

ward Islands, were being implemented, and it submitted the views of the profession in Grenada on Dr Kelly's recommendations. The criticisms of the Grenada Branch include a suggestion that the commencing salary of a Government Medical Officer should be £400 rising after four years' service by increments of £20 to £500, and that officers who had completed 12 years' service should proceed to £600. Dr Kelly had recommended a salary scale of £300 to £400 and then, for selected officers, of £400 to £500. The representatives of the Colonial Office replied that the various recommendations made by Dr Kelly were being substantially carried out. Each Island had agreed to the appointment of a whole time officer at the head of its Medical Department, while, as regards special departments, attention was being given to the setting up of dental clinics, and the acquisition of x-ray apparatus, the improvement of the existing bacteriological laboratories and the extension of the venereal diseases services were receiving close attention. The view was expressed that the salary scale recommended by Dr Kelly might be regarded, on the whole as reasonable, and that suitably qualified local candidates should be attracted to fill medical appointments in the Islands under the new scheme. This scale had not yet been adopted in St. Vincent, but it was hoped that it would be accepted there also before long. It was thought that the position in the Windward Islands as regard to medical matters could generally be regarded as much improved as the result of Dr Kelly's report.

It was mentioned that a suggestion that the three medical Departments in the Windward Group should be combined into a single department had been considered but that it was not regarded as practicable for political reasons. It was only possible to attempt to secure equal conditions of service as between the different Islands, and this had in large measure been achieved.

The substance of the discussion has been communicated to the Grenada Branch, which has been asked for its observations on the progress of the reorganisation.

Restoration of Temporary Deductions from Salaries

146 In consequence of the economic crisis of 1931 and immediately afterwards, most Colonial Governments imposed, as a means of reducing expenditure, a levy on official salaries or reduced or withheld allowances which had been awarded to officers for special duties or in special circumstances. The medical profession accepted these deductions as their contribution towards assisting financial recovery but it was understood that the deductions were temporary, and that full salaries and allowances would be restored as soon as financial conditions permitted. Although it is generally admitted that economic and financial conditions have considerably improved during the last year or two, most of the Colonial Governments have not followed the lead of the Home Government in restoring the deductions.

The Council has been asked by two East African Branches and the Malaya Branch to assist them in securing restoration, but the Council decided to approach the Secretary of State for the Colonies on the general question, and to suggest that the time had come for the restoration of all deductions which were imposed as a temporary measure. The matter was accordingly raised by the deputation which was informed that in all except two Colonies the levies on salaries had now been withdrawn, although suspension of travelling and other allowances was still in force in certain Colonies.

The deputation drew attention to the specific cases of East Africa where the Branches were seeking the restoration of post-mortem fees and fees for giving expert evidence in court, and of Malaya, where the question of the cost of living allowance had been raised. The Colonial Office replied that in Tanganyika payment of post-mortem fees had been restored from January 1 1937 but fees for expert medical evidence given in law courts could not be restored this year. The question would receive consideration, however, in connection with the estimates for 1938. In Kenya the payment of post-mortem fees had also been resumed in the case of officers whose conditions of employment provided for them, and the Governor was being asked what was the

position in relation to the fees for giving expert evidence in law courts. With regard to Malaya, the deputation was informed that the views of Government officers in Malaya were appreciated by the Secretary of State but that no further statement on the matter could at present be made.

Date of Commencement of Service in the Colonial Medical Service

147 The deputation suggested that, for purposes of seniority, salary, and pension of officers in the Colonial Medical Service account should be taken of employment in a hospital immediately preceding appointment. The principle of recognising hospital experience in this way was already adopted in the defence forces, it had there produced beneficial results by encouraging intending applicants to obtain hospital experience, the value of which in the Colonial Medical Service could hardly be overrated, and it would enable intending applicants to qualify themselves in this way without prejudicing their position in relation to officers not so qualified who might be appointed to the Colonial Medical Service at an earlier date.

The representatives of the Colonial Office replied that in the normal course of events applications from persons who had not held hospital appointments were not considered. In particular cases officers might be appointed without such experience but in such cases it would be found that they had obtained compensating or equivalent qualifications or experience in some other way. The Colonial Office believed that the arrangements already in force substantially met the principle underlying the deputation's proposal, namely, that the possession of special qualifications should be reflected in conditions of service.

In spite of the views of the Colonial Office, the Council considers that its proposal would be of great advantage to medical officers and to the Colonial Medical Service as a whole, and it is therefore pursuing the matter further.

Short Service Appointments

148 Medical officers appointed to certain Colonies have the option of retiring on the conclusion of 9 years' service with a gratuity of £1,000, and on the conclusion of 12 years' service with a gratuity of £1,250. A discussion took place with the Colonial Office on the extension of this system to all Colonies.

The representatives of the Colonial Office said that the short service system was foreign to the conception of the Civil Service as one which is intended to provide a life career. The privilege of retiring with a gratuity, where it existed, was peculiar to medical men and was adopted solely as a recruiting attraction. From this point of view the conditions and amounts were less favourable than those offered in the defence services and the Indian Medical Service and the value of the arrangement was doubtful. Experience had not suggested that there was any need to supplement the methods already provided for dispensing with the services of inefficient officers.

British Guiana Medical Service

149 The Government of British Guiana appointed in 1934 a committee to enquire into the administration and general organisation of the medical service of the Colony and to advise on what steps should be taken to improve it. The Committee has recently issued its report, which includes recommendations for the reorganisation of the public health medical staffs, the staffing of the public hospitals and other medical services. It has submitted for the decision of the Government the future method of employment of district medical officers as it is equally divided on the question of whether district medical officers should be subsidised private practitioners or pensionable public officers. The British Guiana Branch has submitted to the Council a memorandum criticising in detail many of the Committee's recommendations and has passed a resolution, for submission to the Secretary of State in which it expresses its opinion that these recommendations if carried out, will be detrimental to the future of the medical service.

Sudan Medical Service

150 New regulations have been issued for the Sudan Medical Service. Although the maximum salaries of the senior appointments have been reduced the Council believes that the new scheme which includes the creation of a number of new senior appointments will offer good prospects to practitioners entering the Service.

Egyptian Medical Service

151 The Council has considered a case submitted by the Egyptian Branch in which a medical officer in the service of the Egyptian Government at Alexandria complains that owing to an amendment of by-laws by the Municipality he is unable to reach the maximum salary which he was promised on appointment. The terms of the appointment contained the statement that the holder would be required to comply with the regulations and by-laws of the Municipality, but the officer did not expect that the clause would relate to his salary scale. The Council considers that it is undesirable that the salaries of medical officers should be governed by by-laws and regulations of the type associated with by-laws and it therefore communicated with the Egyptian Legation in London.

The Council has been unsuccessful in obtaining any modification in favour of the individual officer concerned, or any alteration in the general procedure, but it is pressing for an agreement that, in order to prevent further misunderstandings, future advertisements of medical appointments shall state clearly that an officer's terms of service, including salary, are subject to alteration in accordance with the Municipality's regulations and by-laws.

Order of Precedence of Medical Officers and Right to Wear Uniform

152 Two Branches in East Africa have complained that the newly issued table of precedence and classes, for the wearing of uniform places medical officers in a lower position than that to which they should be entitled and reduces their status in relation to officers in administrative departments. The Council therefore obtained tables of precedence and uniform classes in operation in a number of other Colonies, and has considered them very carefully. It appears to it that the principles adopted in the creation of tables of precedence and of uniform lists have no connexion with such considerations as salaries, length of service, and the number of staff directed, and that these tables and lists should not, in themselves, affect the status of medical officers. The detailed opinion of the Council on the subject has been sent to the East African Branches for their observations.

SCOTLAND

Death of Member of Scottish Committee

153 The Scottish Committee regrets the loss sustained by the death of Dr J. E. Skinner Skene, Aberdeen, who had been a member of the Committee for eleven years.

Report of Departmental Committee on Scottish Health Services

154 A joint meeting of the Scottish Committee and the Insurance Acts Subcommittee (Scotland) was held on October 20, 1937, to consider the action to be taken regarding the report of the above committee.

Five special subcommittees were appointed to prepare a critical digest of the various sections of the report. The findings of the subcommittees are to be submitted to a special joint meeting of the parent committees. The Council will deal with this question in its Supplementary Report.

Scottish Scale of Salaries for Whole-time Public Health Appointments

155 Following upon a request by the Public Health Committee the Scottish Committee has had under consideration the operation of the Scottish Scale. An analysis of the appointments made during the years 1929-36 has been prepared for consideration by the Scottish Committee.

Consultants List for Scotland

156 The scheme prepared by the Consultants and Specialists Group Committee for Scotland for providing consultations at reduced fees to insured persons, their dependants, subscribers to approved public medical services and their dependants and members of approved contributory schemes was submitted to a meeting of the members of the Group held in the Scottish House in January, 1937. It had previously been given general approval by the Representative Body. The Group approved of the scheme, and at the meeting of the Council held on January 20, 1937, the scheme was finally approved. Invitations have been sent to the medical corporations in Scotland to co-operate in the appointment of the supervisory Board.

Sir Charles Hastings Lecture

157 The first Sir Charles Hastings Lecture to be organised in Scotland was delivered by Professor E. P. Cathcart Regius Professor of Physiology, University of Glasgow in the McLellan Galleries, Glasgow on February 3, 1937. The subject of the lecture was 'Food and Nutrition'. The Secretary of State for Scotland presided and there was an attendance of over 700, including representatives of the University of Glasgow, the Royal Faculty of Physicians and Surgeons of Glasgow, the Corporation of Glasgow, the voluntary hospitals and other public bodies. The vote of thanks to the Chairman was proposed by the Chairman of the Scottish Committee.

Air Raid Precautions

158 With the co-operation of the Honorary Secretaries of Branches courses of instruction in anti gas methods have been arranged for in all areas of Scotland.

Organization of the Association in Scotland

159 Steps have to be taken to secure the more effective organisation of the Dumfries and Galloway Division and the formation of a Division for the Outer Islands is at present under consideration.

PARLIAMENTARY ELECTIONS

160 The A.R.M., 1936, directed that steps be taken to make preliminary inquiries for the selection of a medical practitioner intimately acquainted with the aims and policy of the Association, with a view to his election to Parliament through one of the University seats. As a vacancy arose in the Parliamentary representation of the Combined English Universities Sir Henry Brackenbury was invited to stand as a candidate for the by-election. Sir Henry accepted the invitation and stood as an Independent candidate. Sir Henry Brackenbury's election expenses were defrayed from the Representation in Parliament Fund and the Association's machinery was used to further the candidature. The result of the election was particularly disappointing, and the Council feels that the whole position of the Representation in Parliament Fund needs reconsideration. The Council hopes to deal with this matter further in its Supplementary Report.

PHYSICAL EDUCATION

161 The publication of the Report of the Physical Education Committee last year gave an impetus to the desire of various bodies to improve the facilities for physical education for all sections of the community, and the Government itself has prepared an extensive scheme for the promotion of physical education. The Council therefore considered it desirable that the Physical Education Committee should be reappointed with a small personnel, in order that it might keep in touch with the development of physical education, with special reference to the medical aspect.

In February 1937 the Government issued its proposals for the development and extension of the facilities available for physical education for persons no longer attending school. The proposals follow to a considerable extent the recommendations of the Committee, but they differ from

them in one important respect, in that they delegate the requisite advisory duties to a Government body and not to a voluntary body such as the Committee recommended. The Council is doubtful, however, whether any one of the existing organisations is at the present time equipped to fulfil these duties, and the appointment of a Government body seems to it to be the best solution in the circumstances. Two National Advisory Councils have been appointed, one for England and Wales and one for Scotland. They are representative of all types of organisations concerned with physical education, but the Council regrets to observe that the personnel of the English National Advisory Council includes only two medical men, Lord Dawson of Penn and Sir Kaye Le Fleming. It appears therefore that the importance of the medical and scientific aspects of the subject is not yet fully appreciated, and the Council proposes to make its main object the adequate recognition of these aspects.

E. K. LE FLEMING,

Chairman of Council

APPENDIX I

RETURN OF ATTENDANCES

At Council Meetings, from the termination of Annual Representative Meeting, 1936 up to and including April 7th, 1937

COUNCIL

APPENDIX III

MEMORANDUM OF EVIDENCE BEFORE SELECT COMMITTEE ON MEDICINE STAMP DUTIES

The British Medical Association is a company formed for scientific and other useful purposes and not for profit, and is incorporated under the Companies Acts. Its main objects are the promotion of the medical and allied sciences and the maintenance of the honour and interests of the medical profession. It has a membership of over 36,000, which includes the great majority of the practising members of the profession in this country.

The Association undertakes a considerable amount of work which is directly in the public interest, and for many years it has attempted to secure such improvements in the law as would protect the public from the harmful activities of manufacturers and vendors of patent medicines. Although it has directed most of its attention to the question of the advertisement of patent medicines rather than to the Stamp Duties levied on them, it welcomes the opportunity afforded it to submit evidence to the present Select Committee, for it believes that the Committee cannot ignore entirely in its deliberations the general question of the effect on public health of the indiscriminate sale of patent medicines.

The Association's endeavours to combat the danger to public health arising from the unrestricted advertisement and sale of patent medicines began in the early years of the present century, when its activities included the publication of a series of analyses of popular remedies with the object of showing the worthless nature and the trivial cost of preparations for which the makers made grossly exaggerated claims and which were sold at exorbitant prices. Its experience of the subject and the conclusions it reached were embodied in the written and oral evidence which it submitted to the Select Committee on Patent Medicines appointed in 1912. In this evidence it advised the publication on each package of medicine of the name and quantity of each of the constituents, the recognition of the label as a warranty, the application of the Food and Drugs Act to proprietary medicines, the conferment on a Government authority of power to institute legal proceedings against offenders and the amendment of the Indecent Advertisements Act.

The Association warmly welcomed the scheme of control recommended by the Select Committee and it has helped to promote legislation which would introduce such a scheme either wholly or in part. Three Bills in the drafting of two of which the Association assisted have been submitted to Parliament since 1920 but all have been unsuccessful. The reception of these Bills has afforded evidence that Parliament is not yet prepared to authorise the removal of even the worst abuses. That there are no insuperable difficulties inherent in a scheme of control is shown by the efficacy of legislation abroad and the attention of the Select Committee is drawn especially to the success of the Canadian Proprietary or Patent Medicine Act, which for many years has provided a scheme of control very much of the type which the Association would like to see in operation in this country.

Pending the recognition by the Government of the fact that a scheme of control would be in the interests of the public the Association has performed with success a considerable amount of educational work by encouraging the

more responsible newspapers and periodicals to reject objectionable or misleading advertisements. The influence of such voluntary control is, of course, limited, only by some system of close control, under the authority of an Act of Parliament, such as was recommended by the Select Committee can the very real danger to public health be eliminated.

The objections of the Association to the uncontrolled advertisement and sale of patent medicines rest mainly on the dangers which it believes must arise from the encouragement of self diagnosis and self-treatment. The lay person has not the knowledge to enable him to evaluate his symptoms and to diagnose his complaint, neither can he know whether the remedy offered in the advertisement is what is required to cure his individual condition. It is one of the great evils of patent medicine advertising that, while a qualified medical practitioner takes into account the individual characteristics and symptoms of the particular patient, the patent medicine advertiser presumes to offer a stock treatment for all sorts of patients, regardless of individual peculiarities. He also offers the same stock remedy for a host of quite dissimilar conditions. By relying on the plausible claims of the patent medicine advertiser, the patient runs the risk of receiving wrong treatment which may be definitely harmful to him. Moreover, the proper treatment of disease requires not only correct but also early diagnosis. While the patient is resorting to ineffective advertised patent medicines he is losing valuable time, and when eventually he is obliged to consult a medical practitioner he may find that his condition, which might have been easily and quickly cured at an early date, has now reached a stage where treatment is difficult and protracted. This delay is especially serious in certain diseases, and the Association has therefore endeavoured to secure the complete prohibition of the sale, in the absence of a prescription from a medical practitioner, of remedies alleged to relieve or cure the following conditions: Bright's disease, cancer, consumption, diabetes, epilepsy, fits, locomotor ataxy, lupus or paralysis, amenorrhoea, hernia, blindness, and any structural or organic ailment of the auditory system.

Apart from the dangers of self-medication, objection may be raised to the uncontrolled advertisement and sale of patent medicines on the ground that many ignorant or credulous persons are thereby induced to spend to no good purpose, sums of money that they can ill afford. There is no doubt that a considerable proportion of the income of the vendors of these medicines—and of the revenue collected under the Medicine Stamp Duty Acts—is derived from the savings of members of the poorer classes who have been misled as to the properties of the remedies they buy by the exaggerated statements made in the manufacturers' advertisements.

On the subject of revenue, the Association would submit only the observation that the appearance of a Government stamp on a package of medicine tends to create the impression that the remedy itself has received some sort of official approval. It therefore supports the recommendations of the Select Committee on Patent Medicines that references to the Government stamp in advertising matter and the printing on the stamp of the name of a proprietor or firm should be prohibited.

APPENDIX IV

DUTIES OF AND ETHICAL RULES FOR INDUSTRIAL MEDICAL OFFICERS

I Duties

The duties which form the basis of the industrial medical officer's work vary considerably according to the needs of the individual industry or commercial organisation. In the following paragraphs are set out the duties which may properly be undertaken by industrial medical officers when so required.

(i) Examination of applicants for employment and advice as to their selection.

(ii) Immediate treatment of medical and surgical emergencies occurring at the place of employment.

(iii) Examination of persons returning to work after illness or incapacity

(iv) Periodical examination of persons exposed to special hazards

(v) Responsibility for the efficiency of the nursing and first-aid personnel and equipment.

(vi) Advice to the management regarding

(a) The hygiene of the factory

(b) The health conditions of the workers

(c) The occurrence and risk of dangerous hazards

(d) The accident prevention arrangements

(e) Factory legislation concerning health and safety and the special diseases to which the particular industry exposes any worker

(vii) Maintenance of close touch with the management with a view to ensuring that conditions are such as to produce the highest degree of mental and physical welfare of the workers

(viii) Continued observation of all young persons with a recommendation where necessary for the provision of free meals or milk

(ix) Continued observation of all persons returning to work after prolonged illness

(x) The medical supervision of canteens to ensure the cleanliness, good quality and physiological adequacy of the food

(xi) Advice to the works councils welfare departments benevolent fund committees, etc., on any matter affecting the health of the workers

(xii) The arranging and carrying out of such educational work in respect of the health and fitness of the workers as may be desirable and practicable

(xiii) Ready accessibility to employees for medical advice upon matters relating to their work.

(xiv) Encouragement of supervisors to report signs of ill health in any of their workers

(xv) Advice to the management regarding fire and air raid precautions

II Ethical Rules

Subject to statutory requirements these rules shall, where existing ethical rules or custom fail to cover the circumstances, govern the professional relationships between medical officers attached to industrial and commercial concerns their colleagues in general practice, and the workers and staff under their professional care and charge. The rules apply not only to whole time officers but to those employed part-time or in a casual consultative capacity

1 In carrying out their duties industrial medical officers shall be guided generally by the following ethical code

(i) The industrial medical officer shall render such emergency or first aid treatment as is required at the place of employment and shall inform the worker's own doctor of any treatment given. Where further treatment is deemed necessary the worker shall be instructed to consult his own practitioner

(ii) Where there are special facilities or equipment and suitable transport arrangements are available, if it is in the interests of the patient, continuing treatment may be given at the factory clinic with the consent of and in consultation with the worker's own practitioner. In these cases some such form as the following should be used

Dear Sir

Re

Address

This patient has been sent home and advised to consult you. Should you consider that the special facilities of this clinic would be useful for the purpose of applying dressings or carrying out such treatment as you desire, I shall be pleased to arrange for this if you will instruct the patient to report to me

Yours faithfully

Medical Officer

Remarks by patient's own doctor

This note may be handed back to the patient.

(iii) In cases where the industrial medical officer considers that by attending at the factory clinic for dressings or special treatment instead of obtaining such treatment elsewhere the worker might be saved loss of time and/or employment he shall communicate with the worker's own practitioner and offer the facilities of his clinic.

(iv) The industrial medical officer shall not provide treatment in cases of disability, save in such instances as may be covered by an understanding with a committee representative of the local medical profession or where there is an *ad hoc* agreement with the worker's own practitioner. Such treatment shall be given only with the consent of the worker

(v) The industrial medical officer shall consider and advise upon the occupation of any worker whose duties appear to be too heavy or otherwise unsuitable, and where necessary he shall consult the worker's own doctor

(vi) The industrial medical officer shall after communication with the worker's medical attendant (a) examine and advise concerning those workers engaged in hazardous or arduous occupations also those about to be transferred to heavy or dangerous occupations and (b) examine and report to the works management upon those workers who appear suitable for early pension or retirement or in regard to the continuance of invalidity payments

(vii) The industrial medical officer shall not carry out domiciliary treatment.

(viii) A whole time industrial medical officer shall not treat any member of the worker's family who is not employed at the factory

(ix) A part time industrial medical officer shall not utilise his position to influence the worker to choose him as medical attendant or family doctor

(x) The industrial medical officer shall not, except in an emergency, or where a prior understanding with the local practitioners is in operation send any employee direct to hospital. Where he considers attendance at hospital to be necessary or advisable he shall refer the employee to his own medical attendant and may make a suggestion to this effect to the latter

Where, in an emergency the industrial medical officer sends a worker to hospital he shall advise (a) the relatives (if the patient is detained), and (b) the worker's medical attendant

(xi) Where an industrial medical officer has occasion to examine and to report to the management concerning the condition of any worker who is absent from his employment on account of illness and is being treated by his own medical attendant, he shall conform to the Ethical Rules for Medical Inspectors laid down by the Association. In this connexion an industrial medical officer shall, with the consent of his employer place his special knowledge at the disposal of the attending practitioner

(xii) The industrial medical officer should where possible respond to any invitation to meet the worker's practitioner in consultation

(xiii) Except in emergency the industrial medical officer shall not carry out any individual preventive measure without the individual consent of the worker and prior agreement with the worker's medical attendant. He shall in no way associate himself with experiments which involve the active participation of the workers without their consent and the prior notification of the worker's doctor

(xiv) The medical records of the workers maintained by the industrial medical officer are confidential documents. They must remain in the custody of the industrial medical officer or of his deputy. Access to them must not be allowed to any other person save only to another registered medical practitioner and then only at the request or with the consent of the worker

(xv) The industrial medical officer shall at all times be responsible for the safe custody of his medical records. On terminating his appointment he shall make arrangements for the safe custody of his records until such time as it is possible to hand them over to his successor

2. Where nurses are employed by the management the industrial medical officer shall instruct them to maintain the proper ethical code for nurses. Any professional matter must be treated as confidential and disclosed only to the industrial medical officer or the worker's own medical attendant

3 The term 'consultation' in these rules shall be understood to include a written or telephonic communication addressed by the industrial medical officer to the medical attendant. In the absence of a reply within a reasonable time the industrial medical officer shall be at liberty to assume the other doctor's agreement

4 The industrial medical officer shall not hold the position of Certifying Factory Surgeon in the same area as that in which the factory concerned is situate

PUBLIC HEALTH NOTES

Infective Hepatic Jaundice

In his annual report for the year 1936 as school medical officer of the Leicester County Council Education Committee Dr J A Fairer refers to an outbreak of epidemic jaundice which affected a number of villages in the county, twenty six cases occurring among the school population in one village seven four two, and one in others. The incidence among the sexes of the school children was almost equal and twenty-nine out of the forty cases were in children of 6 to 10 years. The chief symptoms were lassitude loss of appetite vomiting abdominal pain, and jaundice, with the passing of pale faeces and dark urine.

Investigations into the milk and water supplies ruled these out as being the means of conveying the infection. It was ascertained, however, 'that a number of cases occurred in young adults working in factories not situated in these villages. It was apparent therefore, that the infection was not of local origin, but was imported by these workers from some outside source and spread from one child to another by direct contact. More commonly, however outbreaks of this type of epidemic jaundice, which fortunately rarely give rise to serious illness, are largely confined to children of school age, the infection being assumed to be one of direct contact, with an incubation period of some twenty-eight days, so that cases most commonly occur in crops at, roughly monthly intervals with no fresh cases in the intervening periods. Bacteriological findings as in this case are negative. A useful summary of present knowledge of these cases appeared in the *British Medical Journal* of January 9 1937 (p 67), this being an account of an address delivered by Dr Hugh Barber on 'Infective Hepatic Jaundice'.

Municipal Midwives in Manchester

The Manchester Public Health Committee is inviting applications from certified midwives with post certificate experience of midwifery for the city's municipal midwifery service, at a commencing salary of £215 per annum, rising to £295. Seventy posts are available, and the midwives are to work in groups of four to six in different areas of the city, an arrangement which will permit some choice of midwives by the mother. The usual fees charged by midwives in private practice (£2 for a first confinement and £1 15s for a subsequent one) have been adopted as the standard and only if a midwife's services are asked for at a lower rate will the applicant's income be investigated. With the approval of the city's public health authorities the Manchester and District Midwifery Teachers Group, a voluntary organization has arranged an eight-week post graduate course to be taken at St Mary's Crumpsall, and Withington Hospitals. The fee is £8 8s., and the course provides for six weeks study in a maternity hospital one week in an isolation hospital and one week at municipal clinics. The aim of the course is to give domiciliary midwives particularly those in rural areas and midwives in small maternity homes an opportunity to see the work that is being done in the large centres and to study modern methods.

Pathological Laboratories

In connexion with the survey which is being made of the laboratory provision for public health work through out the country the Minister of Health has issued a questionnaire to all county councils and local authorities. The medical officer of these authorities is asked (1) to

describe the laboratories provided by the council giving the size of the staff, (2) to give the addresses of laboratories used by the council and the names of the pathologists, and (3) to state whether there are any premises in the authority's area—for example, school or industrial laboratories—which could in an emergency be adapted at short notice.

THE INSURANCE MEDICAL SERVICE WEEK BY WEEK

The Press and the Panel Service

The medical service procedure for dealing with complaints is sometimes regarded by those whose opinion commands respect as a vexatious and perhaps undignified procedure. But it has long been accepted as inevitable in a system where every registered medical practitioner has the right to enter the service. It is of course clear that where an authority has the right of selecting those who shall engage in the service such elaborate machinery for dealing with disciplinary questions would be entirely out of place. It may fairly be said that the medical service procedure, troublesome though it is, is designed for the doctor's protection, and in particular a case can always be dismissed as frivolous or vexatious without a hearing or even a formal investigation on the papers where this appears to be warranted.

With these considerations in mind we may note the appearance of an unusual crop of reports presented at the last meeting of the Middlesex Insurance Committee. In four cases which were heard the recommendation—some what unusual in form—is simply that 'the case be dismissed'. In the first of these cases there is evidence of difficulty with the insured person's mother. 'The subcommittee think that it is to be regretted that possibly owing to a misunderstanding Dr B considered it necessary to ask the mother to leave the consulting room.' In the second case we read of a complaint by the son of a deceased insured person regarding the indifferent and offhand treatment given to his father by the insurance practitioner upon whose list his name appeared (For example, Dr A said to his father who was ill in bed, 'Sit up—the practitioner's explanation of this remark being that sitting up was the proper position for a patient in this condition').

The third case was the always difficult question (so unsuitable for this sort of tribunal) of dealing with a complaint that the doctor failed to make a correct diagnosis. The somewhat lengthy account of the visits and the treatment given leads the subcommittee to the conclusion that the doctor was careful and assiduous in his attention. In the fourth case there are the usual telephone misunderstandings, and conflicting evidence as to the doctor ringing the bell and getting no reply.

Perhaps in all these four cases there may be some reasonable impatience on the part of the respondent practitioner with the medical service procedure. The remaining case is one which has attracted unusual notice in the Press and merits rather fuller comment. The evidence of the doctor in this was accepted in substance as a fair recital of the whole of the facts and may be set out in full for the better appreciation of the notes which follow.

Dr A (a woman practitioner) stated in writing and in evidence before the subcommittee that on December 19 1936 a message was received at her house between 6 and 7 p.m. that at the time the message was left she was out at an urgent operation and did not get back to her surgery until 8 p.m. that the message which was received by her door attendant was to the effect that the insured person had been in bed all day had a tight cough and requested a visit that the messenger also stated that she thought that the insured person would be all right in the morning that the messenger was informed that she was out at an urgent operation but that on her return she would leave a prescription for a cough

mixture but that the messenger was to return before 8 o'clock that on returning from the operation she felt ill and was very tired but she wrote out a prescription that no one had called for the prescription by 9.30 p.m. that about 10 p.m. a messenger called again, but was not seen by her that the messenger was asked why she had not called before 8 o'clock, and stated that she had been to Dr B. that the messenger was given the prescription and told to take it to the chemist's side door and ask him to make it up that this was not done that at 10.30 p.m. the insured person's mother called and stated that the insured person's breathing was tight and her cough troublesome that she made up a bottle of medicine provided some tablets and a bottle of liniment that she told the insured person's mother that the insured person was to have a dose of medicine and take one of the tablets and that if she were not better in a couple of hours to send for her and she would come immediately but that in any event she would visit in the morning that the insured person's mother then said that she thought her daughter would be all right in the morning that she told the insured person's mother that in any case she would make it her first visit in the morning that she did not remember the insured person's mother requesting her to make a visit then that she told the insured person's mother that if her daughter fell asleep she was not to waken her for treatment that she heard nothing more that night, that at 9.30 the next morning Sunday December 20 she was just leaving her house in order to visit the insured person when a messenger came asking her to call that she went immediately that he made a careful examination of the insured person took her temperature which was 100° her pulse which was 120 and respirations (34) that she also carefully examined the back and front of the chest and found no dullness in the bases of the lungs that she came to the conclusion that the insured person was suffering from extreme capillary bronchitis that she advised the insured person's mother to send the insured person to hospital that both the mother and the insured person expressed a wish to stay at home that she thereupon wrote a note to the district nurse asking her to call twice a day that on leaving the house she told the mother that she would come again at any time if she or the nurse desired her to do so that about 12 o'clock another message came asking her to visit the patient, as she had become suddenly worse that she went immediately that she did not examine the patient on this occasion, as she saw that she had become suddenly worse that she advised that the insured person should be removed immediately to hospital to which the insured person's mother agreed that she made arrangements for a bed at the Hospital as she knew the local hospital was full up that she also made arrangements for an ambulance and that the insured person was removed in a very short time that on her first visit on Sunday December 20, there were no signs of pneumonia.

It is very interesting to note the views of the subcommittee which made the investigation the insurance committee which received the report, and the Press which, to put it mildly imports prejudice into the case. The subcommittee found as facts

1 That the insured person was taken ill on Friday evening, December 18 1936 and Dr A. was sent for on Saturday December 19 1936 at about 6.40 p.m.

2. That Dr A. was out but on her return received a message that the insured person had sent for her

3 That Dr A. wrote a prescription and herself feeling ill went to bed

4 That later in the evening when the insured person's mother called Dr A. came down and made up some medicine for the insured person and stated she would come in two hours if it was urgent.

The subcommittee was of opinion (a) that Dr A. committed an error of judgement in not attending the insured person on Saturday December 19 1936 (b) that Dr A. committed an error of judgement in not allowing Dr B. to visit the insured person on Saturday December 19 1936 (c) that the errors of judgement mentioned in (a) and (b) were due to Dr A.'s physical condition

The insurance committee after discussion, decided against the error of judgement and recommended that the Minister should withhold £5 from the doctor's remuneration

By the time the report reaches the Press it appears with the following headline 'Woman Doctor Left Note on Window-sill Girl was Dying' and the following editorial comment

"We don't like this. A woman doctor is called to a panel patient not once but twice and does not go. Another doctor being sought he likewise refuses saying, quite properly that the patient is not on his list, and advises the family to go back to the woman doctor. The woman doctor again does not go but graciously consents to leave a prescription. The patient is later taken to hospital and dies. I was very tired says the doctor. Quite so but the patient is very dead. We are not allowed to publish that doctor's name or we would.

When one reads a comment of this sort, in which anything that could be said in the doctor's favour is suppressed one can at least reflect with satisfaction that cases of this kind receive a full and impartial investigation by the carefully balanced tribunal set up under the regulations

The Insurance Obligation and a Private Grievance

The following extracts from a report of the Birmingham Medical Service Subcommittee may be quoted as a reminder that the practitioner should not allow any private matters to come into conflict with his responsibilities under the insurance terms of service

The doctor stated that the complainant had been owing money to the practice for several years, and that was the cause of the trouble. Shortly before this question arose he had been ill with influenza and his locumtenent had been attending a patient at the complainant's house in a private capacity and this still further increased the complainant's indebtedness to him. On the morning in question a small child came to the surgery with a message asking the doctor to visit her sister. He concluded at the time that it referred to the patient for whom his locumtenent had been providing treatment privately and thought it would be a good opportunity to raise the question of the bill. He therefore sent back a request that the complainant should see him. A few minutes later the complainant called and he then learned for the first time that it was an insured person he had to visit and he certainly remembered thinking to himself that he would have to visit her. He then referred to the question of the outstanding bill whereupon the complainant became very annoyed and said that she would fetch another doctor and before he had an opportunity of replying she walked out of the surgery leaving him under the impression that another practitioner would be summoned. He heard nothing further until the receipt of the committee's communication. There was no question of a refusal to visit the insured person but he did not visit as the complainant stated that she would call in another doctor

The subcommittee was satisfied that the doctor was requested to visit and treat the insured person that the insured person's condition required treatment and that the doctor did not visit and treat the insured person as required by the terms of service for insurance practitioners

Certifying Incapacity of a Hospital In-patient

The particular pitfall in the case of an insured person in hospital whose relatives ask the insurance practitioner for certificates of incapacity has been referred to in these notes on a previous occasion. It is unfortunate that a hurried reading of Rule 18 may leave a practitioner with the impression that while he is under no obligation to give certificates in such a case he may do so if he wishes. A moment's reflection however should be sufficient to ensure that the practitioner cannot possibly fill up the official form of certificate in such a case. The following extract from a report presented to an insurance committee this week is worthy of reproduction as it makes the position abundantly clear

"The practitioner admitted frankly that he had issued the two certificates at a time when he knew that the insured person had been admitted to hospital but he said that he did this because he understood from the insured person's wife that the family were considerably embarrassed financially and he explained to her when issuing the certificate on December 20 1936 that any further certificates should be obtained from the hospital. On December 28 1936 the wife again approached him, and said that her husband had omitted to obtain the hospital certificate, and that without a certificate it would not be possible for sickness benefit to be obtained

It is a matter for surprise that an insurance practitioner whose name has been included in the Medical List for some fourteen years should have issued certificates of incapacity in the circumstances indicated above. It should be known to all insurance practitioners that adequate arrangements exist for obtaining certificates from a hospital in respect of in-patients and the mere fact that an insured person has failed to obtain such a certificate cannot be regarded as justifying an insurance practitioner in signing a statement which he knows is not true—that is that he has examined the insured person. It would appear that the practitioner has failed to appreciate the wording of the certificate or his duties under the Medical Certification Rules. Rule No 9 provides that a practitioner having issued a certificate under the rules shall not issue a further certificate without again examining the insured person. In other words it is clearly indicated that an examination of the patient must be made before the issue of each certificate. For the convenience of all concerned in the administration of the Act and of practitioners particularly an arrangement has been made for printed forms (as provided by the Minister of Health) to be supplied to practitioners. The certificate contains a statement of fact—namely that the person in respect of whom it is issued was examined on a particular date. If a practitioner certifies that he has made an examination of a patient on a particular date when in fact, no such examination has taken place the certificate is misleading and we are bound to take serious notice of his action.

NATIONAL REGISTER OF MEDICAL AUXILIARIES

A useful piece of work has been brought to completion in the *National Register of Medical Auxiliaries* replacing and amplifying the Roll of Biophysical Assistants which has been published from time to time in special issues of the *Supplement*. The *Register* contains the names of over 4,000 auxiliaries who are described comprehensively as 'physiotherapists, and, on a separate list, the names of about 230 dispensing opticians'. The names of those practising in London are arranged according to postal districts, and in the country according to counties, with separate headings for the towns in each county. There is also a list with all the names arranged alphabetically. It is indicated where the person registered is a medical auxiliary in private practice or a State registered nurse, and the qualifications are shown by initials—M for massage, MG for medical gymnastics, ME for medical electricity, LET for light and electrotherapy, HT for hydrotherapy (all these being qualifications under the Chartered Society of Massage and Medical Gymnastics), M.S.R. and F.S.R. for the membership and fellowship respectively of the Society of Radiographers, and B.P.A. meaning biophysical assistant. This last category refers to the qualification formerly given by the Society of Apothecaries of London but which is given no longer, its place having been taken by one of the qualifications of the Chartered Society.

A glance through the geographical list shows that the medical auxiliaries are by no means uniformly distributed. In London for example they flourish in the Hampstead district to the number of not far short of a hundred, while some of the east and south-east districts have none at all. The W1 district, which includes the consultants' quarter, has the services of just over eighty. In the country the number of auxiliaries is particularly large in Lancashire and Cheshire which have about twice as many as Yorkshire, Nottinghamshire and Lincolnshire combined. There are seventy in Hertfordshire but in the neighbouring Bedfordshire only sixteen, and in Huntingdonshire only two.

Origin of the Register

The genesis of this *Register* may be briefly recalled. In 1928 the Annual Representative Meeting of the British Medical Association adopted a resolution calling for suit-

able courses of training for persons who wished to administer electricity and radiation, the names of the persons who had satisfactorily followed such a course to be entered on a roll. It was laid down as a condition of inclusion that an undertaking must be given to abstain from the treatment of any patient except on the responsibility and under the general supervision of a medical practitioner. An arrangement was thereupon made with the Society of Apothecaries, whose action in the matter cannot be too highly appreciated, whereby a register of such persons was instituted under the none too happy name of biophysical assistants. It was soon realized however, that this was not comprehensive enough, and in 1933 the Representative Body approved a proposal for the establishment of a national register on a wider basis. The Society of Apothecaries again co-operated with the British Medical Association in this effort, as did the Chartered Society of Massage and Medical Gymnastics, the Society of Radiographers, and the Association of Dispensing Opticians. A Board of Registration was formed, which was incorporated in 1936, the council of the Board consisting of representatives of these five bodies under the presidency of Mr H. S. Souttar, one of the representatives of the British Medical Association.

Disciplinary Rules

Those admitted to the *Register* give the undertaking already mentioned, not to practise medical auxiliary work except under the direction and control of a medical practitioner, and also agree not to advertise their services except through certain specified channels and not to sell goods to patients in a professional capacity or accept commission on the sale of goods. These last requirements are varied in the case of dispensing opticians, whose scope of work differs materially from that of the physiotherapists. The disciplinary rules of the Board are set out in the preliminary part of the *Register*. An endeavour has been made to follow, with suitable modifications, the practice of the General Medical Council, the Dental Board, and other bodies which regulate professions, although of course, these are statutory bodies and the Board of Registration is not. The grounds for compulsory removal include action derogatory to the honour of the profession, disgraceful or discreditable conduct, whether in connexion with the profession or not, and a breach of the undertakings which have been given. The medical auxiliary may have his name removed from the *Register* on a conviction for a felony or misdemeanour, the words 'after due inquiry' are not used in this case as they are in connexion with other grounds for removal, and the discipline as it stands seems rather wide when there are so many convictions for technical offences which convey no imputation against moral or professional character.

The *National Register of Medical Auxiliaries* will serve the excellent purpose of maintaining contact between practitioners and qualified assistants in these ancillary fields, it will encourage the employment of qualified persons, and will provide information on the subject not only to the medical profession but to local authorities and other official bodies. It is suggested that sectional *Registers* may be compiled on a geographical basis corresponding with Branches and Divisions of the British Medical Association.

ABERDEENSHIRE PANEL COMMITTEE HONOURS DR ROBERT BRUCE

Dr Robert Bruce DSO of Culis near Aberdeen has completed twenty five years as secretary to the Aberdeenshire Panel Committee and to mark the occasion and also his election as chairman of that committee he was entertained to dinner by his colleagues on March 25 and presented with a gold wristlet watch. Thirty five representatives of the profession in Aberdeenshire including local consultants sat down to dinner over which Dr John Findlay of Peterhead presided. Dr A. V. Webster (Fraserburgh) in making the presentation paid tribute to Dr Bruce. He said that as the only medical

man to have commanded an infantry battalion in France Dr Bruce had served his country faithfully in war. In peace time he had done yeoman service as chairman of the Aberdeenshire Territorial Association and as honorary colonel of his old battalion the 5th-7th Gordon Highlanders. His interests and activities were many. But above all he was the perfect family doctor, and it was in that capacity and as secretary of the Panel Committee a laborious and thankless service which he had carried on for so many years that he was being honoured that night. Dr Bruce in thanking those present for the honour accorded him said that in anything he had done he had been actuated by a lifelong desire to promote friendship within the ranks of the profession.

Dr Bruce is a most active member of the British Medical Association. He was chairman of the Aberdeen Division from January 1930 and from November of that year to August 1932 chairman of the Aberdeen and Kincardine Counties Division. He has also been president of the Aberdeen Branch.

FREE CHOICE OF DOCTOR IN ESSEX

In Essex the county council inaugurated the free choice of doctor scheme as an experiment for a period of twelve months from January 1, 1936, in the following medical relief districts

	Estimated Population	Number of Approved Medical Practitioners participating on December 31, 1936
Walthamstow	134,490	42
Chingford	29,690	16
Clacton	21,030	3

In Walthamstow the services of a full-time nurse are also available for assisting in the patients' homes.

In reviewing the scheme after a period of twelve months the county medical officer, Dr W. A. Bullough, makes the following observations:

1. All approved medical practitioners have been visited and it was found that the records of patients have been reasonably well kept by the doctors, and the patients would appear to be getting satisfactory treatment.

2. The most noteworthy point is the higher percentage of women and children over men—roughly about 10 per cent were men. The high percentage of children might be explained by the fact that last year there was a prevalence of measles in the district of Walthamstow and Chingford.

3. No excessive prescribing has been noted.

4. The relations between the approved medical practitioners and the relieving officers and chemists have been excellent throughout the year.

5. The approved medical practitioners have no complaints against the scheme and so far as I am aware very few complaints have been received from patients. After inquiry and visits to the doctors concerned any troubles have been adjusted.

From the estimated figures available as to the cost of the scheme to the county council, there is, of course, some increase as compared with that of the district medical officer services in the areas prior to the operation of the scheme. Nevertheless the county council has agreed to continue the scheme for a further period ending March 31, 1938, after which time it is hoped that the data available will permit of a more detailed report being drawn up.

The West Riding Public Health Committee has prepared a scheme for a municipal midwifery service which provides for the appointment of two inspectors of midwives, 56 Grade II midwives and 133 Grade I midwives and for co-operation with the West Riding County Nursing Associations and 124 District Nursing Associations. The fees charged for the services of municipal midwives will be £1 10s for confinements in which the midwife takes full charge of the case, and £1 when she acts as maternity nurse only. If the total family income after deducting 5s for each child under 14 years of age does not exceed 30s a week the county council will pay two thirds of the fee for a midwifery case and half of it for a maternity nursing case.

Correspondence

THE VOLUNTARY HOSPITAL AND CONTRIBUTORY SCHEMES

SIR—In commenting on Lavman's letter in the *Supplement* of April 3 (p. 167) I would like to draw attention to a serious fallacy in his argument.

He assumes that contributory schemes are not capable of paying more than 70 per cent of the cost of hospital maintenance—that they often do not is unfortunately the case. In my opinion the hospitals are actually losing money on a transaction in which they have converted the services of their honorary staffs to the benefit of a class of patient which used to pay sufficient in fees to provide for the support of a few of the younger consultants. Owing to the no questions asked clause it is impossible to obtain exact information but my own impression is that the contributory schemes are mainly used not by the indigent or by those who would ordinarily pay nothing to the hospital for their keep but by those who could afford to pay at least maintenance charges and often some kind of professional fee as well. To suggest that people cannot afford more than the cost of five cigarettes or half a tumbler of small beer a week to insure against a risk valued at from £8 to £30 a year in the open market is ridiculous. Unfortunately the contributory schemes are only anxious to increase their membership without regard to the quality of the service given or the remuneration of the people who do the work and the least troublesome way of doing this is to keep the subscription as low as possible and not to inquire too closely into the circumstances of their members.

The honorary staffs were persuaded to accept the contributory scheme principle by a promise of a fair share of the proceeds to compensate them for loss of fees and for such improvement in the equipment and facilities of the hospital in which they worked as would give them the conditions requisite for the satisfactory performance of their function.

Lavman and others should know that despite the strong bias in favour of traditional institutions natural in a conservative profession the voluntary hospital system no longer enjoys the unqualified favour of the younger generation of consultants the majority of whom would even welcome a State service.

The present system in that it is satisfactory to nobody but the retired folk who take their recreation on boards of management is moribund and an organized refusal by the profession to work the contributory schemes as they stand would result in an efficient medical service for everybody—I am etc.

Hove April 9

J. H. TWISTON DAVIES.

THE COUNTRY DOCTOR AND THE HOLIDAY SEASON

SIR—There is one aspect of the position of certain country doctors as compared with that of their town brethren which does not seem to have been considered sufficiently either by the Ministry of Health or by the British Medical Association. Doubtless owing to the more healthy and less strenuous conditions under which our work is usually performed we do not stand in quite so much need of holidays as our urban friends but it is becoming more and more difficult for us to arrange for any change at all. Here for instance the population is so thinly distributed over wide areas that we find it impossible to undertake a neighbour's work even in normal times for more than a few days and when the influx of summer visitors descends upon me I am more tied down than ever. Times being what they are the expense of a locum tenent makes a proper holiday almost out of the question.

Many of the visitors who more than double our local population for three months of the year are insured. I consider that if one is to be responsible for attendance upon probably an addition of at least 100 extra panel patients for a quarter of the year some recompense should be made. The pious hope that temporary residents of this type will either bring their medical cards with them or produce them when requiring attention is never realized. And I have never

received any extra payment at all owing to some peculiar circumstance which I have never understood. In any case even if temporary resident payment were made the extra inconvenience due to lack of attention to rules on the part of these visitors ignorance of surgery hours, etc. makes claims hardly worth rendering and the extra load very heavy. If an equal number of our local people went off for holidays or the fishermen left for other ports some compensation might be made, but the failure of the herring fishing trade has reduced the number of large boats to three so that very few of that class ever go away now. I seem to spend the summer and autumn months in a haze of hard work compared with the rest of the year—no time for sharing the recreation of my family, no time to "play" with my friends. And no chance of even a holiday at the wrong time unless a quite unreasonable amount of money is spent.—I am, etc.,

Berwickshire April 14

COUNTRY DOCTOR.

BOOKS ADDED TO THE LIBRARY

The following books were added to the Library of the British Medical Association during March

- Anderson A K Laboratory Experiments in Physiological Chemistry 1936
Blair, V P and Ivy, R H Essentials of Oral Surgery Second edition 1936
Boyd, M F Preventive Medicine. Fifth edition 1936

Naval, Military, and Air Force Appointments

ROYAL NAVAL MEDICAL SERVICE

Surgeon-Captain P L Gibson to the *President* for course
Surgeon Commanders L S Goss O.B.E. and J S Elliot have retired at their own requests with the rank of Surgeon Captain
Surgeon Commander R L G Proctor to *President* for course
Surgeon Lieutenant Commanders T W Froggatt to *St Angelo*, for Royal Naval Hospital Malta, J J Keevil to the *Leander* and lent to New Zealand Division for three years E J Mockler to the *Ganges* D R F Bertram to the *St Angelo* for Royal Naval Hospital Malta, F Dolan to the *Drake* for Royal Naval Barracks J L Malone to the *Pembroke* for Royal Naval Barracks
Surgeon Lieutenants W W Simkins to the *Furlough* T McCarthy to the *Drake* for Royal Naval Barracks April 15, and to the *Centurion* on commissioning, C J Roberts to the *Halejon* F Bush to the *Pembroke* for Royal Naval Barracks I C Macdonald to the *Pembroke* for Royal Marine Infirmary Deal, H O Connor to the *Arrow* W H C M Hamilton to the *Falcon* T A M Maunsell to the *President* for course (May 3) and to the *Drake* for Royal Naval Barracks (May 25), F A Crossill to the *London* R V Jones to the *Challenger* R L Norsworthy and G R Rhodes to the *Drake* for Royal Naval Barracks, B O Neil to the *Pembroke* for Royal Naval Barracks P G Stainton to the *Victory* for Royal Naval Hospital, Haslar F P Ellis to the *Pembroke* for Royal Naval Hospital Chatham W S Miller to the *Shropshire* A J Glazebrook to the *Excellent* (May 13) and to the *Tedworth* on commissioning
The seniority of Surgeon Lieutenants N M McArthur I McN A Drysdale T A Turnbull and C J Roberts have been antedated to October 10 1935 April 16 1936 August 16, 1936 and October 16 1936 respectively
The seniorities of Surgeon Lieutenants C J P Pearson F W Baskerville, I C Macdonald P G Burgess and W H C M Hamilton have been antedated to October 16 1935
G L Hardman J F Meynell, W S Parker, and W B Teasey to be Surgeon Lieutenants

ROYAL NAVAL VOLUNTEER RESERVE

Surgeon Captain L S Ashcroft to the *President*
Surgeon Lieutenant Commanders E F St. J Lyburn to the *Resolution* S B Borthwick F E Stabler and T C Larkworthy to the *President* C Seeley to the *Royal Sovereign*
Surgeon Lieutenant F T Land to be Surgeon Lieutenant Commander
Surgeon Lieutenants G C Martin have been transferred from List 1 of the Mersey Division to List 2 of the London Division G L Foss to the *President* D R Maitland (probationary) to the *Victory* for Royal Naval Hospital, Haslar
Surgeon Sublieutenant L Foster to be Surgeon Lieutenant

ARMY MEDICAL SERVICES

Major-General FitzG G Fitzgerald, C.B., D.S.O. late R.A.M.C., has retired on retired pay
Col G G Tabuteau D.S.O. late R.A.M.C. to be Major General and to continue in his present appointment as Deputy Director of Medical Services Northern Command
Col J W L Scott, D.S.O. late R.A.M.C. has relinquished his appointment as Deputy Director-General Army Medical Services War Office, and has been promoted Major-General
Col H H A Emerson D.S.O. late R.A.M.C., to be Major General (superannuated) and retains his appointment
Col F Casement, D.S.O., late R.A.M.C. from Assistant Director-General, to be Deputy Director-General, Army Medical Services War Office
Cols A Dawson O.B.E. and A E S Irvine, D.S.O. late R.A.M.C. have retired on retired pay
Lieut-Col S W Kyle from R.A.M.C. has been appointed Assistant Director-General, Army Medical Services War Office and to be Colonel with seniority July 1 1936
Lieut-Cols A N R McNeill, D.S.O., and H Gall from R.A.M.C. to be Colonels

ROYAL ARMY MEDICAL CORPS

Majors R. H. Alexander R W Galloway F G Flood and W Frier to be Lieutenant-Colonels

ROYAL AIR FORCE MEDICAL SERVICES

Wing Commanders B F Haythornthwaite to R.A.F. Station, Calshot for duty as Medical Officer H S C Starkey O.B.E., to No 3 Flying Training School Grantham, for duty as Medical Officer
Squadron Leaders C G J Nicolls to R.A.F. Station Gosport for duty as Medical Officer P D Barling to R.A.F. Station Feltwell for duty as Medical Officer
Flight Lieutenants O S M Williams to Princess Mary's R.A.F. Hospital Halton G H J Williams to Home Aircraft Depot Henlow
Flying Officers R F Courtin to R.A.F. Depot Uxbridge N P R Clyde to R.A.F. Station Waddington D F Shaw to R.A.F. Station Harwell

REGULAR ARMY RESERVE OF OFFICERS

ROYAL ARMY MEDICAL CORPS

Major C M Rugby, having attained the age limit of liability to recall has ceased to belong to the Reserve of Officers

SUPPLEMENTARY RESERVE OF OFFICERS ROYAL ARMY
MEDICAL CORPS

Lieutenant R. L. Walmsley to be Captain

TERRITORIAL ARMY

Col A P Watson O.B.E. having attained the age limit retires and retains his rank with permission to wear the prescribed uniform

ROYAL ARMY MEDICAL CORPS

Lieutenant T W Preston to be Captain
J L Murray (late Officer Cadet Durham University Contingent Medical Unit, Senior Division O.T.C.) and A. D. Kelly (late Cadet C.S.M. Durham School Contingent Junior Division, O.T.C.), to be Lieutenants

TERRITORIAL ARMY RESERVE OF OFFICERS ROYAL ARMY
MEDICAL CORPS

Captain H W A. Post from Active List to be Captain

INDIAN MEDICAL SERVICE

Major-Generals Sir Cuthbert Allan Sprawson, Kt., C.I.E., and A W M Harvey have retired from the Service

Major-General E W C Bradfield C.I.E., O.B.E., Officiating Director General, Indian Medical Service has been confirmed in his appointment as from March 1

Major-General W H Hamilton C.I.E. C.B.E. D.S.O., has been appointed to be Deputy Director of Medical Services, Northern Command from February 9 vice Major General A. W M Harvey C.B., retired

Colonel W H Hamilton, C.I.E. C.B.E. D.S.O., to be Major-General

Lieut.-Col A F Babonau C.I.E., O.B.E., to be Colonel with seniority February 2, 1937

Lieut.-Cols J J Harper Nelson, C.I.E., O.B.E., M.C. and F W Hay have retired from the Service

Lieut.-Col R H Candy Civil Surgeon and Superintendent B.J. Medical School Poona, has been appointed to officiate as Surgeon-General with the Government of Bombay as from February 10 pending assumption of charge by Colonel H C Buckley

Lieut.-Col D H Rai M.C., has been appointed to officiate as Inspector-General of Civil Hospitals Punjab as from March 12 or the date on which he may assume charge vice Col C H Reinhold granted leave

Lieut.-Col W E R Dimond Assistant Director of Public Health North West Frontier Province has been appointed to officiate as Inspector-General of Civil Hospitals and Inspector-General of Prisons of that Province as from January 14 till further orders

Lieut.-Col J M R Henoessy Civil Surgeon, Jubbulpore has been appointed to officiate as Inspector-General of Civil Hospitals Central Provinces vice Col N M Wilson granted leave as from February 17 till further orders

Lieut.-Col T D Murison Director of Public Health Assam, has been appointed to officiate as Inspector-General of Civil Hospitals and Prisons Assam as from March 31 till further orders
The services of Lieut.-Col R C Clifford M.C. D.S.O. have been placed at the disposal of the Chief Commissioner Delhi for appointment as Civil Surgeon New Delhi as from February 15

Lieut.-Col H E Shortt Officiating Director King Institute, Guindy, has been confirmed in that appointment as from August 13 1936 vice Lieut.-Col H H King retired

Majors D Sanyal S M A Faruki B B Gadgil D P McDonald A N Sharma P N Basu J J Rooney S L Patney, D N Bhaduri B Basu O.B.E. M A Jafaray G Verghese and A D Loganadan to be Lieutenant-Colonels

Major G C Maitra an officer of the Medical Research Department at present officiating as Director Pasteur Institute Rangoon has been confirmed as Director Pasteur Institute Kasauli as from August 13 1936 vice Lieut.-Col H E. Shortt He will continue to be employed as Officiating Director Pasteur Institute Rangoon, until further orders

The services of Captain Said Ahmad have been placed temporarily at the disposal of the Government of the United Provinces with effect from the forenoon of February 4 1937

COLONIAL MEDICAL SERVICE

The following appointments are announced B S Jones F.R.C.S., Medical Officer West Africa Miss Marjorie J Lyon F.R.C.S., Medical Officer Malaya G E McVie M.B. Ch.B., Medical Officer West Africa Sir Robert G Archibald C.M.G. D.S.O. M.D. Medical Superintendent Chacabacare Lepers Settlement Trinidad G E Craig M.B. Ch.B. Alteration of Areas of Brighton, Eastbourne,
and Hastings Division

With reference to the preliminary announcement as to the above which appeared in the *Supplement* of March 20 (p. 144), notice is hereby given by the Council of the Association to all concerned that as from the date of this notice the areas of the Brighton, Eastbourne and Hastings Divisions will be as follows

Brighton Division County borough of Brighton municipal boroughs of Hove and Lewes urban districts of Burgess Hill, Cuckfield, East Grinstead Newhaven, Portslade-by-Sea and Seaford and rural districts of Chailey, Cuckfield and Uckfield

Eastbourne Division County borough of Eastbourne and rural district of Hailsham.

Hastings Division County borough of Hastings municipal boroughs of Bexhill and Rye and rural district of Battle

G C ANDERSON

Medical Secretary

April 24 1937

Branch and Division Meetings to be Held

ABERDEEN BRANCH CITY OF ABERDEEN DIVISION—At Aberdeen Royal Infirmary Foresterhill Thursday April 29 8.30 p.m. Visit to new X Ray Department Demonstration of a ray films and treatment cases by Dr Blewett and staff

BIRMINGHAM BRANCH WEST BROMWICH AND SMITHWICK DIVISION—At West Bromwich and District General Hospital Thursday April 29 8.30 p.m. Dr A V Neale Clinical Demonstration

BORDER COUNTIES BRANCH—At Cumberland Infirmary Carlisle Thursday May 6 3.15 p.m. Dr Robert Gow McInnes Mental Health

DERBYSHIRE BRANCH BUXTON DIVISION—At Devon Fire Poul Hospital Buxton Tuesday April 27 8.15 p.m. Film "Modern Treatment of Fractures"

DORSET AND WEST HANTS BRANCH BOURNEMOUTH DIVISION—At Boscombe Hospital Bournemouth Wednesday April 28, 8.15 p.m. Dr Margaret Vivian Auto-serum Treatment in Drug Addiction Dr Stephen Horsley Treatment of Acute Delirium

FIFE BRANCH—At Station Hotel Kirkcaldy, Thursday April 29 3 p.m. Annual General Meeting Election of officers etc

KENT BRANCH—At Royal Star Hotel Maidstone Wednesday April 28 2.45 p.m. Discussion The Doctor and the Milk Supply To be opened by Dr Constant Ponder

KENT BRANCH EAST KENT DIVISION—At Grand Hotel, Cliftonville, Thursday April 29 8.45 p.m. Dr R. W. Durand (Assistant Medical Secretary) Public Medical Services—their influence on the Future of General Practice

LANCASHIRE AND CHESHIRE BRANCH BURY DIVISION—At Jersey Hall Bury Friday May 14 Coronation dinner and dance

LANCASHIRE AND CHESHIRE BRANCH SOUTHPORT DIVISION—At 52 Hulton Street, Southport Friday, April 30 8.30 p.m. Meeting to discuss recommendations re Annual Report of Council

METROPOLITAN COUNTIES BRANCH HENDON DIVISION—Tuesday, April 27 Annual meeting

METROPOLITAN COUNTIES BRANCH LEWISHAM DIVISION—At St John's Hospital Lewisham S.E. Tuesday April 27, 8.45 p.m. Clinical meeting

METROPOLITAN COUNTIES BRANCH WILLESDEN DIVISION—At Central Middlesex County Hospital Acton Lane Harlesden, N.W. Tuesday April 27 3 p.m. Dr H. Carter Demonstration of Cases

NYASALAND BRANCH—At King Edward VII Memorial Hall, Blantyre, Saturday June 5 10 a.m. Scientific meeting

SOUTH WALES AND MONMOUTHSHIRE BRANCH SOUTH WEST WALES DIVISION—At Carmarthenshire Infirmary, Carmarthen Wednesday, April 28, 3 p.m. B.M.A. Lecture by Dr Daniel T. Davies Influence of the Mind on Organic Structural Disease

SUSSEX BRANCH BRIGHTON DIVISION—At Lady Chichester Hospital New Church Road Hove Tuesday April 27 3.45 p.m. Clinical meeting Preceded by a special meeting to consider a motion for the Annual Meeting at Belfast

YORKSHIRE BRANCH GOOLE AND SELBY DIVISION—At Londonborough Arms Hotel Selby Tuesday April 27 8.30 p.m. Dr H. G. Garland (Leeds) After-effects of Head Injuries Preceded by supper at 7.45 p.m.

YORKSHIRE BRANCH HUDDERSFIELD DIVISION—At George Hotel, Huddersfield Wednesday April 28 8.45 p.m. Mr L. Dougal Callender Round the World in Fifty Minutes Preceded by dinner at 7.30 p.m.

TABLE OF OFFICIAL DATES

May 8 Sat.	Publication in <i>B.M.J. Supplement</i> of list of Nominations for Election of (i) 22 Members of Council by grouped Branches in Great Britain and Northern Ireland (ii) 2 Public Health Service Members of Council and 4 representatives of Public Health Service in Representative Body Voting Papers posted from Head Office where there are contests in above elections Applications for B.M.A. Research Scholarships and Grants must be received at Head Office by this date
May 10 Mon.	Motions by Divisions and Branches for A.R.M. Agenda on matters of which two months notice must be given must be received at Head Office by this date
May 15 Sat.	Publication in <i>B.M.J. Supplement</i> of Motions and Amendments by Divisions and Branches for A.R.M. on matters of which two months notice must be given Representatives and Deputy Representatives must be elected by this date Last day for receipt at Head Office of Voting Papers for election where there are contests, of (i) 22 Members of Council by grouped Branches in Great Britain and Northern Ireland (ii) 2 Public Health Service Members of Council and 4 representatives of Public Health Service in Representative Body
May 29 Sat.	Publication in <i>B.M.J. Supplement</i> of result of election of Members of Council and result of above elections Nomination Papers available (on application at Head Office) for election of 11 Members of Council by grouped Representatives
June 2, Wed.	Council.
June 3 Thurs.	Names of Representatives and Deputy Representatives must be received at Head Office by this date
June 19 Sat.	Publication of Supplementary Report of Council in <i>B.M.J. Supplement</i>

June 29 Tues.	Other items for inclusion in A.R.M. printed Agenda must be received at Head Office by this date
July 16 Fri.	Annual Representative Meeting Belfast
July 17, Sat.	Annual Representative Meeting, Belfast
July 19 Mon.	Annual Representative Meeting Belfast Council Belfast
July 20 Tues.	Annual Representative Meeting Belfast Annual General Meeting Belfast Presidents Address
July 21 Wed.	Council Belfast Conference of Honorary Secretaries Overseas Conference Belfast Meetings of Sections etc Belfast
July 22, Thurs.	Meetings of Sections etc Belfast Annual Dinner of the Association, Belfast.
July 23 Fri.	Meetings of Sections etc Belfast

Meetings of Branches and Divisions

LINCOLNSHIRE BRANCH KESTIVEN DIVISION

At a meeting of the Kesteven Division held at Grantham on March 23 with Dr W. H. WILKIE in the chair, the following officers were elected for the ensuing year

Chairman Dr R. H. Hudson Honorary Secretary Mr F. Joselyn Jauch

Dr A. MACRAE (Assistant Medical Secretary) gave an address on Some Intraprofessional Relationships. Dr Macrae said that it was in order for the specialist including a pathologist to notify general practitioners that he was prepared to accept work from them, and for a change of partnership including an amalgamation, to be notified to patients. When giving lectures the use of handbills should be avoided. A locum tenens attended in confidence, and it was wise to get a written agreement in the interests of both sides. Nevertheless there might be circumstances in which it would be considered unfair for a locum tenens to be debarred for all time from practising in the same district. The practice of dichotomy was to be regarded as reprehensible. A dentist was entitled like any other surgeon to choose his own anaesthetist who need not be the patient's own doctor. Though a doctor's dependants are usually treated free of charge this was a courtesy and the matter was not one of obligation or ethics. A practitioner asked in consultation is debarred from attending a patient during the existing illness. Above all the guiding principles in intraprofessional relationships were the freedom of the patient to choose his own doctor and the co-operation in the interests of the patient of the doctors concerned with the case. A consultant should be made aware of the attendant doctor's views and treatment particularly if the general practitioner is unable to attend during the consultation itself as otherwise the consultant might pass a remark which might be held to reflect upon the general practitioners treatment. A consultant should say nothing which might undermine the patient's confidence in his medical attendant.

At the conclusion of his address Dr Macrae was accorded a hearty vote of thanks. He was previously asked to convey to the Editor of the *British Medical Journal* the Division's appreciation of the considerable general improvement of the *Journal*.

MALTA BRANCH

At a clinical meeting of the Malta Branch held at the University on January 15 Dr WALTER GANADO opened a discussion on Infant Care in Malta. Dr Ganado opened with some remarks on the comparatively high infant mortality in Malta. Most of the responsible factors he said were at present beyond control and although much was being done under great difficulties arising out of the limited economic resources there was scope for more work to improve existing conditions. The housing problem called for urgent solution. The ignorance prevailing among mothers might also be remedied though the problem of education was admittedly a difficult one. Much might be gained by adequate teaching and organized propaganda in which teachers, nurses, district nurses and medical practitioners could co-operate. Mothers might be made aware of the dangers arising from comforters, dirty bottles, prolonged lactation, overclothing, inadequate ventilation and improper handling of babies. Irregular feeding was the commonest cause of dyspepsia in infants and the whole scheme of proper feeding should be patiently explained to the mother.

Discussing some points in infant feeding that called for special attention in Malta Dr Ganado said that the baby

should be fed at fixed intervals and as a rule no feed should be given at night if through lack of appetite the infant did not take the usual amount no more food should be given before the next feeding time. The merits of breast feeding were well recognized nevertheless advertisements on artificial milks were exerting a pernicious influence and were leading certain mothers to wean their babies too early. A common pretext was that the breast milk was getting deficient in quality or in quantity. If a breast fed baby was not thriving satisfactorily it was wise to look for such common causes as abnormal shape of the nipples, bad habits during nursing, or irregular feeding. Defects in the composition of the milk should next be considered. The poor quality of the milk might be due to the poor health of the mother. If a baby developed symptoms of undernutrition mixed complementary feeding should be started and an attempt made to improve the health of the mother. Vomiting and colic which were usually attributed to the large globules of fat in breast milk, were more often due to overfeeding and aerophagy.

Deficiency in quantity was a more common cause of trouble. In obtaining a good and steady flow much depended on the attention given in the first few days following childbirth. The common galactagogues such as beer were very unreliable. Prolactin as prepared at present was of doubtful value and its price was prohibitive. Good results were often obtained by giving an abundant quantity of fresh milk increasing the protein foods regulating the intake of fluids and avoiding overfatigue and excessive perspiration. The nipples should be stimulated by giving both breasts at each feed and by making the interval between feeds as short as possible. A night feed might be allowed and if the child did not empty the breast completely a breast pump should be used after each feed.

Dr Ganado said that if mixed feeding was not started a definite clinical picture due to underfeeding would develop, leading to wasting. Under feeding was the commonest cause of constipation in breast fed infants and was often the presenting symptom. The chief danger of mixed feeding was that the child refused the breast for the bottle and this led to disappearance of milk if the mother was not persistent. Dr Ganado proceeded to describe the technique of complementary feeding, which ought to be regulated in terms of calories, according to the weight and age of the child.

Though statistics were not available as to the incidence of infantile nutritional anaemias in Malta Dr Ganado thought that they were very common in the large families of the lower classes. The chief danger of these anaemias lay in the fact that they caused dyspepsias and a lower resistance to infection. There were two main causes of these anaemias (1) deficient iron storage in the liver as in twins premature infants, and those born from anaemic mothers, and (2) delayed iron supply when the congenital liver storage was exhausted. They could be prevented in three ways (1) By the energetic treatment of anaemia in mothers with adequate doses of iron (2) By adequate diets during pregnancy which should contain a minimum of 15 mg of available iron a day when this was not feasible medicinal iron should be given (3) By the adequate supply of iron-containing foods to the baby when it reached the proper age this should start in the fifth month by adding the yolk of an egg in small increasing doses. In the treatment of infantile nutritional anaemia iron was best given directly added to the bottle or as a sweetened mixture. Dried milks containing iron were available. The dose recommended by Mehuvar varied from 4 to 9 grains of iron and ammonium citrate a day. Dilute solutions of copper sulphate manganese and vitamin B extracts had also been suggested.

In the discussion that followed most of the members present took part.

Another clinical meeting was held on March 12 also at the University. The meeting was well attended. Dr J E H GATT opened a discussion on "The Indications for Venesection" in which several of the members present took part.

Dr Gatt was elected delegate to the Annual Meeting at Belfast.

METROPOLITAN COUNTIES BRANCH CHelsea DIVISION

At a general meeting of the Chelsea Division held on March 25 with Dr E. FAIRFIELD THOMAS in the chair Dr S D MITCHELL opened a discussion on child guidance from the private practitioner's point of view. He emphasized the necessity of treating the child as well as its home and school environment and cited two illustrative cases. In one severe epigastric pains and other symptoms were found to be associated with a repugnance to mathematics due to interference with education consequent on repeated accidents and illnesses

as well as to home troubles. In the second stealing and wandering propensities were traced to a repressed desire to go to sea and to hostility to a bad home environment. Both cases responded very successfully to psychiatry associated with environmental changes. Dr Mitchell discussed the co-operation between the child guidance clinic and the private practitioner illustrating his remarks with the case of a girl who required polyglandular therapy as well as psychiatry. He had had no difficulty he said in arranging for these cases to receive the necessary physical treatment from private practitioners or hospitals but there was still much to be done to promote closer co-operation. A brisk and practical discussion followed relating mainly to the lines of treatment advisable in different types of case.

A cinematograph demonstration was given of the preparation of antitoxins prophylactics and vaccine lymph by Messrs Evans Sons Lescher and Webb Ltd.

METROPOLITAN COUNTIES BRANCH HENDON DIVISION

At a meeting of the Hendon Division held at the Metropolitan Police Laboratory on March 9 Dr JOHN C THOMAS read a paper on Blood Groups and Paternity. After discussing the constitution of the four main groups A B AB and O together with the subgroups A₁ and A₂ and the types M and N Dr Thomas went on to explain the mechanism of the heredity of the group substances pointing out that they were not solely the property of the red cells but of all the body tissues and fluids and in most cases of the body secretions as well. The properties A and B were inherited as Mendelian dominants the recessive allelomorph R occurring in Group O. In explaining the method of transmission of these factors he pointed out the two laws of heredity of the blood groups: first that the factors A and B could never be present in the child unless they were present in one or other of the parents non-conformity to this law being absolute incontestable proof of illegitimacy secondly that the combinations AB parent and O child and vice versa were genetic impossibilities. In view of the fact that one exception to this law had been demonstrated (the child was malformed and suffered from a severe anaemia so that this case was probably one of non-development of the specific factors) non-conformity to this rule should be considered as strong circumstantial though not absolute evidence of illegitimacy.

After working out the possible parent-child combinations, Dr Thomas went on to show how a man's chances of proving his innocence in a paternity case vary with the group to which he belongs being worst in Group AMN (1 in 13) and best in Group ABN (2 in 3) the average chance for all men being about 1 in 3. The reported exclusions from many different countries were analysed and in 11 per cent. of all paternity cases innocence was proved by the use of the blood group test (using M and N) the test proved the innocence of one man in three, which meant that about 33 per cent. of all the paternity applications were made against innocent men. In England and Wales there have been for the last ten years an average of 7,200 affiliation applications in from 700 to 800 of which innocence could be proved by the blood group test.

Dr Thomas then discussed the draft legislation which had been prepared in collaboration with legal authorities and which was proposed for this country. The draft is as follows.

Draft Legislation Relating to the Application of the Blood Grouping Test in Cases of Disputed Paternity

Whenever it shall be relevant in any action to determine the parentage or identity of any person or body the court may direct any party to the action and the child of any such party and any other person involved to submit to one or more blood grouping tests to determine whether or not the defendant can be excluded as being the father of the child the specimens for the purpose to be taken and the tests to be made by one or more registered medical practitioners as the court shall direct who are specially qualified by training and experience in the making of blood group classifications and under such directions as the court shall deem proper.

Whenever such tests are ordered to be made the results thereof shall be admissible in evidence but only in those cases where exclusion is established.

The order for such blood grouping tests may also with the consent of all parties direct that a certified copy of the evidence of such experts may be admissible as evidence without the attendance of such experts at court.

The court shall determine how and by whom the costs of such examinations shall be paid.

Whenever the court orders such blood grouping tests to be made and one or more of the parties shall refuse to submit

to such tests such fact shall be disclosed at the trial unless good cause is shown to the contrary

Explaining the various points in this draft Dr Thomas emphasized that it was essential that the court should order the test and that non submission should be treated in the same way as non submission to an order for a medical examination in a nullity suit or to a writ of *de ventre inspiciendo*—that is, as a reasonable implication of guilt in the absence of good cause to the contrary. There was no reason why the man should refuse, and a woman who was certain of her case should likewise submit to the test. The purpose of the test was defined in the draft and in order to exclude the drawing of false inferences in those cases in which exclusion had not been possible it was proposed only to admit the evidence in cases in which definite exclusion had been established. It was essential that the test should be performed by a specially trained expert, this being the opinion of the authorities in all countries. Although the test was simple in principle there were possibilities of error which if not excluded would lead the test into disrepute. It was desirable although not essential, that the evidence of such experts should be able to be taken on paper without the necessity of their attendance at court.

METROPOLITAN COUNTIES BRANCH WILLESDEN DIVISION

At a meeting of the Willesden Division held at Willesden General Hospital on March 17 Dr LEVI SIMPSON spoke on The Menopause.

Dr Levi Simpson said that it was helpful and justifiable to regard the menopause as a physiological castration, from which there resulted a series of endocrine changes spread over a period of years (the climacteric). Experimental castration was followed by hyperplasia and hyperactivity of the pituitary gland with an increase in the number of basophil cells many of which lost their granules and became vacuolated (castration cells). There was a corresponding increase in the gonadotropic potency of the pituitary gland and in the female a measurable increase in the amount of gonadotropic hormone excreted chiefly prolactin A. Another major sequel of experimental castration was hyperplasia of the adrenal cortex. In the female the latter together with basophil changes in the pituitary gland constituted the pathological basis of Cushing's basophilism syndrome and its four major features—adiposity, hypertension, virilism and impaired carbohydrate tolerance—were also frequent manifestations of the climacteric. The overactivity of the pituitary spread to its other hormones. Thus excess of the thyrotropic hormone would explain menopausal hyperthyroidism, the diabetogenic hormone—diabetes, the growth hormone—mild acromegaly, the lactogenic hormone—persistent lactation in menopausal pregnancy etc. Physiological castration was not a complete explanation of climacteric symptoms because a woman completely ovariectomized at 30 would nevertheless suffer an exacerbation of menopausal symptoms at 45 or 50.

The giving of oestrin was a logical method of suppressing pituitary hyperactivity. In the ovariectomized rat it would cause disappearance of the pituitary castration cells and in woman (apart from the relief of many symptoms) the disappearance of prolactin A from the urine, a return of the carbohydrate tolerance to normal and a change in the vaginal smear to an oestrous type were methods of measuring its effects. Sometimes large doses were necessary to abolish symptoms, and these might cause a tense feeling in the breasts. Other non-endocrine therapeutics should be exploited in order that the dose of oestrin should be minimal. Experimental evidence suggested that prolonged and continuous administration of maximum doses of oestrin might lead to cystic hyperplasia of the breasts but the consensus of opinion was against the likelihood of malignant changes supervening.

Dr Simpson was accorded a very hearty vote of thanks for his address on the motion of Dr C F T SCOTT.

NORTH OF ENGLAND BRANCH NORTH NORTHUMBERLAND DIVISION

At a meeting of the North Northumberland Division held at Belford on February 17, Dr ALAN BOLAM (Newcastle-upon-Tyne) gave an address on "Common Skin Diseases and their Treatment."

At a further meeting of the Division held at Alnwick Infirmary on March 17 Mr T A HINDMARSH (Newcastle-upon-Tyne) delivered an interesting lecture on "The Surgical Treatment of Toxic Goitre." Mr Hindmarsh illustrated his remarks by lantern slides and gave a cinematograph demonstration of partial thyroidectomy.

It was agreed that meetings of the Division should be held during the summer and autumn months, it being felt that the attendance at meetings would be improved by this procedure. A programme for the summer and autumn will be prepared at a meeting of the Division at Belford on April 21.

POST-GRADUATE NEWS

The Fellowship of Medicine announces the following courses: dermatology at St John's Hospital, May 3 to 29, thoracic surgery at Brompton Hospital, May 24 to 29, urology at St Peter's Hospital, May 31 to June 12, gynaecology at Chelsea Hospital for Women, June 14 to 26, chest diseases at Brompton Hospital, May 8 and 9, physical medicine at St John's Clinic and Institute of Physical Medicine, May 22 and 23, children's diseases at Princess Elizabeth of York Hospital, May 29 and 30, general medicine at Prince of Wales General Hospital, June 5 and 6, obstetrics at City of London Maternity Hospital, June 12 and 13. The following courses will be held for M.R.C.P. candidates: clinical and pathological at National Temperance Hospital, Tuesdays and Thursdays, at 8 p.m. June 1 to 17, chest diseases at Brompton Hospital, twice weekly, at 5 p.m., June 7 to July 3, heart and lung diseases at Victoria Park Hospital, Wednesdays and Fridays, at 6 p.m., June 9 to July 3, neurology at West End Hospital for Nervous Diseases, June 21 to July 3. The annual dinner-dance of the Fellowship will take place at Claridge's Hotel on Friday, May 28. Tickets can be obtained from the secretary of the Fellowship of Medicine, 1, Wimpole Street W., or from any member of the Ladies Committee. All members of the medical profession and their friends will be welcome.

A course of lectures on pathological research in its relation to medicine has been arranged for the summer session at the Institute of Pathology and Research, St Mary's Hospital W., on Tuesdays at 5 p.m., from April 27 to June 22 (except May 11). The lectures will be given in the lecture theatre of the bacteriological department of the Institute and they are open to all members of the medical profession and to all students in medical schools without fee. Abstracts of the lectures will be embodied in the weekly advertisements in the *British Medical Journal* prior to the lecture concerned and details will also be published in the post graduate diary column of the *Supplement* week by week.

The London School of Dermatology has arranged a course of lectures at St John's Hospital for Diseases of the Skin, 5, Lisle Street, Leicester Square, W.C., from May 3 to June 4. The fee for the course is £2 2s, which includes attendance at the practice of the hospital, payable in advance to the secretary of the hospital or to the Fellowship of Medicine, 1, Wimpole Street W. Registered medical students will be admitted free to the lectures only details of which will be published in the post graduate diary column of the *Supplement* week by week. A course of twelve lessons in practical pathology of the skin will also be given at a fee of £4 4s.

The Joint Tuberculosis Council announces that Dr Peter W. Edwards will hold a short intensive post graduate course of a practical nature on modern methods of therapy in tuberculosis of the respiratory system, with special reference to collapse therapy at the Cheshire Joint Sanatorium (where there is abundant material for the demonstration of artificial pneumothorax and allied procedures) from May 25 to 27. Methods of sanatorium administration will also be demonstrated. The fee for the course is £2 7s, which includes lunch and tea at the sanatorium. All inquiries to be addressed to Dr William Brand, honorary secretary for post graduate courses, Joint Tuberculosis Council, 8, Christ Church Place, Epsom, Surrey.

WEEKLY POST-GRADUATE DIARY

BRITISH POST-GRADUATE MEDICAL SCHOOL, DUCANE ROAD, W.—Daily 10 a.m. to 4 p.m. Medical Clinics, Surgical Clinics and Operations, Obstetrical and Gynaecological Clinics and Operations, Refresher Course for General Practitioners. Mon. 2.30 p.m. Dr C. W. Buckley, Arthritis. Wed. 12 noon, Clinical and Pathological Conference (Medical). 2 p.m. Dr Miles, Agglutination Tests as Aids to Diagnosis. 3 p.m. Clinical and Pathological Conference (Surgical). 4 p.m. Mr J. F. H. Roberts, Surgery of the Chest. 4.30 p.m. Dr W. F. Gye, Experimental Cancer Research. Thurs. 2.30 p.m. Dr Duncan White, Radiological Demonstration. 3.30 p.m. Mr A. K. Henry, Demonstrations on the Cadaver of Surgical Exposures. 3.40 p.m. Colonel L. W. Harrison, Gonorrhoea in Women. Fri. 2 p.m. Operative Obstetrics. 3 p.m. Clinical and Pathological Conference (Obstetrics and Gynaecology).

VACANCIES

All advertisements should be addressed to the Financial Secretary and Business Manager and NOT to the Editor

ALDERLEY EDGE ANCOATS HOSPITAL CONVALESCENT HOME Great Warford—Hon Visiting M.O. Honorarium £50 p.a.

ASHFORD GROSVENOR SANATORIUM—R.H.P. (male) Salary £100 p.a.

AYLESBURY ROYAL BUCKINGHAMSHIRE HOSPITAL—Second R.M.O. (male) Salary £150 p.a.

BANGOR CAERNARVONSHIRE AND ANGLESEY INFIRMARY—(1) Senior H.S. (2) J.H.S. Salaries £140 p.a. and £100 p.a. respectively

BARKING BOROUGH—Assistant M.O.H. and Assistant School M.O. Salary £500 £25 £700 p.a.

BATH ROYAL UNITED HOSPITAL—H.S. (male unmarried) for the Ear, Nose and Throat Department. Salary £150 p.a.

BECKENHAM BETHLEM ROYAL HOSPITAL—(1) Consulting S. (2) Radiologist Honorarium £157 10s. p.a.

BECKENHAM BOROUGH—Assistant M.O.H. and School M.O.

BEDFORD COUNTY HOSPITAL—(1) First H.S. (2) Second H.S. Males unmarried Salaries £155 p.a. and £150 p.a. respectively

BIRKENHEAD AND WIRRAL CHILDREN'S HOSPITAL—Assistant Hon. S. BIRMINGHAM CITY—R.A.M.O. (male unmarried) for the Tuberculosis Section Salary £400-£25 £450 p.a.

BLACKBURN ROYAL INFIRMARY—R.H.S. (male) Salary £175 p.a.

BOSTON GENERAL HOSPITAL—R.M.O. (male) Salary £150 p.a.

BRIGWATER GENERAL HOSPITAL—H.S. Salary £130

BRIGHTON NEW SUSSEX HOSPITAL FOR WOMEN—H.S. (female) Salary £100 p.a.

BRISTOL GENERAL HOSPITAL—Third H.S. Salary £80 p.a.

BRITISH POST-GRADUATE MEDICAL SCHOOL Ducane Road W.—Three Part-time Demonstrators in Clinical Medicine Honorarium £100 p.a.

BURY INFIRMARY—(1) Third H.S. (2) C.O. Males Salaries £140 p.a. each

BURY ST EDMUNDS WEST SUFFOLK GENERAL HOSPITAL—H.S. Salary £180 p.a.

CARDIFF ROYAL INFIRMARY—H.S. to the Ophthalmic Department Salary £80 p.a.

CARDIFF WELSH NATIONAL SCHOOL OF MEDICINE—Temporary full time Junior Assistant in the Medical Unit Salary £240 p.a.

CHESTERFIELD AND NORTH DERBYSHIRE ROYAL HOSPITAL—H.S. (male) to the Ophthalmic and Ear, Nose and Throat Departments Salary £150 p.a.

COVENTRY CITY—A.M.O. (female) Salary £500-£25 £700 p.a.

CROYDON COUNTY BOROUGH—Assistant M.O.H. and Assistant School M.O. (male) Salary £500-£25 £700 p.a.

DARLINGTON MEMORIAL HOSPITAL—H.S. (male) Salary £140 p.a.

DONCASTER ROYAL INFIRMARY AND DISPENSARY—Casualty H.S. (male) Salary £175 p.a.

EDINBURGH PRINCESS MARGARET ROSE HOSPITAL FOR CRIPPLED CHILDREN—Junior R.S.O. Salary £50 p.a.

ELIZABETH GARRETT ANDERSON HOSPITAL Euston Road N.W.—(1) Staff Appointment of Part-time Pathologist in charge of the Department of Morbid Anatomy and Bacteriology Salary £350 p.a. (2) Part-time Radiologist Honorarium £200 p.a.

(3) Hon. Assistant S. to the Throat, Nose and Ear Department (4) Hon. P. to the Children's Department Females

ENNISKILLEN FERMANAGH COUNTY HOSPITAL—Surgeon Superintendent. Salary £750 p.a.

EXETER ROYAL DEVON AND EXETER HOSPITAL—(1) H.P. (2) H.S. to the Ear, Nose, and Throat Department (males) Salaries £140 p.a. each.

FINCHLEY MEMORIAL HOSPITAL Granville Road N.—R.M.O. Salary £140-£200 p.a.

GENERAL LYING-IN HOSPITAL York Road Lambeth S.E.—J.R.M.O. and Anaesthetist Salary £100 p.a.

HORNSLEY CENTRAL HOSPITAL Park Road N.—(1) Hon. P. to Children's Ward (2) Hon. Genito-Urinary S. (3) Hon. Anaesthetist

HULL ROYAL INFIRMARY—(1) H.P. to the Sutton Branch (2) Second H.P. to the Main Hospital (3) Second C.O. to the Main Hospital Males Salaries £160 p.a., £140 p.a. and £140 p.a. respectively

HULL VICTORIA HOSPITAL FOR SICK CHILDREN—R.H.P. (female) Salary £120

HUNTINGDON COUNTY HOSPITAL—H.S. Salary £120 p.a.

ILFORD KING GEORGE HOSPITAL—(1) Hon. Chief Clinical Assistant to the Orthopaedic and Fracture Department (2) F.S.O. Salary £250 p.a. (3) Medical Registrar Salary £140 p.a. (4) Two H.S.s. Salaries £100 p.a. each Males

KETERING AND DISTRICT GENERAL HOSPITAL—(1) R.M.O. (2) Second R.M.O. (male) Salaries £160 p.a. and £140 p.a. respectively

KIDDERMINSTER AND DISTRICT GENERAL HOSPITAL.—(1) Hon Consulting P (2) Pathologist Honorarium £100 p.a.

LANCASHIRE MENTAL HOSPITALS BOARD.—Whole-time Deputy Medical Superintendent for Calderstones Certified Institution for Mental Defectives Whalley Salary £750-£25-£850 p.a.

LEEDS GENERAL INFIRMARY.—R.M.O. (male) Salary £200 p.a.

LEICESTER CITY.—R.M.O. (male) for the City Isolation Hospital and Sanatorium Salary £300 p.a.

LEICESTER CITY MENTAL HOSPITAL Hummerstone.—Locumtenens A.M.O. (male) Salary £10 10s per week

LINCOLN COUNTY PARTS OF LINDSEY.—A.M.O. (female unmarried) Salary £500-£25-£700 p.a.

LINDSEY COUNTY OF THE PARTS OF.—Assistant County M.O. and District M.O.H. (male) Salary £800 p.a.

LIVERPOOL AND DISTRICT HOSPITAL FOR DISEASES OF THE HEART.—H.P. Salary £100 p.a.

BIRTHS, MARRIAGES, AND DEATHS

The charge for inserting announcements of Births Marriages and Deaths is 9s which sum should be forwarded with the notice not later than the first post on Tuesday morning in order to ensure insertion in the current issue

BIRTHS

CUNNINGHAM.—On April 10 1937 at Miss McCabe's Nursing Home Londonderry to Dr and Mrs Ronald Cunningham (John and Molly) a son

HOLLINGSWORTH.—On April 17 at The Lawn Axminster Devon to Molly wife of Anthony Hollingsworth M.B., B.S. a son

DEATH

JAMES.—On April 16 after a long illness Dr Alfred Herbert James M.R.C.S. L.R.C.P. aged 51 at 3 Hill Top Green Lane Morden Surrey son of the late Dr Alfred James M.R.C.S., L.S.A.

times of development are given in parentheses. In the treated animals the teeth erupted at birth (9 days), hair appeared at 1 to 2 days (14 days), the eyes opened at 1 to 2 days (14 days), the testes descended at 3 to 4 days (35 days), and the vagina opened at 16 days (60 days). At 60 days the average weight of the seventh generation was 180 grammes against the control weight of 100 grammes. This excessive rate of growth is, however, not maintained, and slackens off from the end of the second month, and although the animals remain larger than the controls they do not become giant rats. The serum calcium and phosphate are raised, and there is an increase in the dimensions of the bones. Stress is particularly laid on the fact that these animals tend to have no increased susceptibility to sudden death from shock. The adrenals are found to be small, and there is lymphatic hyperplasia, especially in the intestine. Rowntree's work suggests that thymus extracts can stimulate physical, sexual, and psychical development, at any rate during the early months of life, in the rat. But it must be remembered that so far these results have not yet been confirmed.

Pineal Gland

Even less is known about the physiology of the pineal gland than about the thymus. Rolleston has admirably summarized the older views on the subject which are distinguished by an entire lack of support of either clinical or experimental facts. The pineal is a small red oval body which projects from the roof of the third ventricle just above the posterior commissure and close to the Sylvian aqueduct. According to Keith the human pineal develops as an evagination of the ependymal lining of the posterior part of the forebrain. The pineal is proportionately much larger in the foetus than in the adult, and is very well supplied with blood. It contains calcareous concretions (corpora amylacea), which consist of chalky deposits on whorls of connective tissue and on the neuroglia. They appear first in childhood, and according to Harris are a prominent feature in radiographs of the skull in middle life. The histology of the gland undergoes considerable modification from the middle of foetal life to childhood but finally it consists of blocks of large faintly staining cells separated by a good deal of connective tissue and large sinus-like blood vessels. Calvet regards all the pineal cells as neuro-epithelial in origin and states that all stages of transition can be traced between the pineal cells and neuroglia. Some workers claim that involution begins before puberty and others insist that the gland is structurally identical in childhood and old age.

Excision of the pineal is difficult and the results obtained are conflicting. Rowntree removed the pineal in a small series of rats in four successive generations but obtained no evidence of altered development or rate of growth.

Tumours of the pineal besides giving rise to neighbourhood symptoms are sometimes associated with precocious puberty and precocious growth of the body. According to Warburg pineal lesions in early life give rise to three endocrine pictures: (1) premature genital development, (2) cachexia and (3) universal adiposity. Some of these changes may be due to involvement of the hypothalamus. In the rare so-called pineal syndrome or macrogenitosomia praecox (which usually affects boys) rapid skeletal growth takes place in the first six years and is then followed by the early union of the epiphyses.

Pineal Extracts

The injection of pineal extracts has yielded inconclusive results. Engel claims that it inhibits the action of the growth hormone of the anterior pituitary. Hanson has prepared extracts of pineal, the most potent of which is a relatively non-toxic acid derivative which is somewhat irritating locally. The extract contains 0.6 per cent citric acid, but control experiments show that injections of citric acid in similar amounts are without effect. The extracts have been injected into successive generations of rats and the results obtained are roughly the opposite of those described for thymus extracts. In the first generation no effect was noted other than moderate loss of weight. In the second generation there was definite retardation of growth, with precocity in gonadal development. In subsequent generations these features were accentuated producing a picture of precocious dwarfism with relatively large genitals. The animals are physically weak and irritable and the dwarfism is permanent, though it becomes less striking as the animals get older.

It is exceedingly doubtful whether the evidence available at the moment is sufficient to warrant the inclusion of the pineal or the thymus among the ductless glands which secrete specific hormones.

PEOPLE'S LEAGUE OF HEALTH

GUILDHALL BANQUET IN AID OF APPEAL

A banquet was held at the London Guildhall on April 15 in support of the national appeal of the People's League of Health. The appeal is for £50,000 to place the work of the League on a secure financial basis. Hitherto it has engaged in much effective enterprise including the carrying out of special investigations and health propaganda on surprisingly small and uncertain resources. The League is concerned with the prevention of disease and dispersal of its causes by the education of the public and such means as offer working through medical, veterinary and science councils which are very representative and include many distinguished persons.

The LORD MAYOR (Sir George Broadbridge) who was accompanied by the Lady Mayoress and attended by the Sheriffs presided over the banquet. He was supported by Viscount Leverhulme the chairman of the Appeal, Sir Robert Kindersley the treasurer and Miss Olga Aether sole the founder and honorary organizer of the League. The company present which also included the Belgian ambassador was widely representative of the Church, medicine, industry, social services and other sides of the national life. Mr. H. S. Souttar was present for the British Medical Association. During the evening nurses from the hospitals which are co-operating with the League in an investigation into maternal nutrition took a collection at the tables which resulted in £5,000 in cash and promises.

The health of the City hosts having been proposed by Sir ERNEST BURN and acknowledged by the Lord Mayor the toast of the evening that of the League was proposed by the BISHOP OF LONDON who proffered himself as an example of abounding health doing at least twenty-

none the same things as he did at twenty-nine, and rather better. He ascribed his health to four simple rules: no alcohol, no tobacco, moderation in eating, and regular exercise. Lord HORDER who responded said that he must not be tempted from the toast to say much about health in general, but he did wish that people would not speak of health as if it were something artificial, something that could be put on or taken off like a garment; it was actually a state of body and mind. The Prime Minister speaking recently on nervous strain in industry said that we knew little or nothing about it. Lord Horder was uncertain as to the meaning of the pronoun. If it meant the Cabinet although he was surprised he accepted the modest avowal, but if Mr Baldwin was speaking for doctors he contended that they knew a great deal about nervous strain. People were no longer mown down in large swathes by epidemic fevers, but they were caught in the machine in a number of ways and it was to help to extract them from the machine so that they might enjoy the benefits which medical science gave them in other directions that the League existed and worked. He himself was proud to be one of the League's panel of medical advisers. Experts did not run the League, but it made full use of experts.

Mr Baldwin told us in the same speech that he dreaded the mass mind. So do I. But I am not sure that I do not dread more than the mass mind the untrained mind that is too knowledgeable and gets into the saddle, and I think we are troubled with this both in our public and private lives. Lord Horder also brought the good wishes of the Royal College of Physicians of London in the absence of its President, Lord Dawson.

Sir WALTER LANGDON-BROWN who also replied to the toast said that in this country it generally happened that the necessity and advantages of an enterprise had first to be established by voluntary agency and then the State stepped in and expanded it. By the inauguration of the physical fitness campaign, and also by the establishment of the Advisory Committee on Nutrition the Government was really in effect following out the policy which the League had been setting forward during the last eighteen years. He paid a warm tribute of gratitude and admiration to the League and to its founder, Miss Nethersole, who was a skilled campaigner and had chosen the right moment to sound an advance. There was a new spirit of optimism abroad. The winter of our discontent seemed to be passing in spite of blizzards on the Continent. We have got out of the Slough of Despond and are well set on the journey to the Delectable Mountains, but the House of the Interpreter lay between those two points on the journey, and there the League intends to reserve very roomy accommodation to interpret the lessons of medicine and science in everyday life.

The National Council for the Unmarried Mother and her Child (117 Piccadilly W 1) has published a pamphlet reprinted from *Mother and Child* entitled *The Unmarried Mother: A Few Notes for Student Health Visitors*. The author is Miss Susan Fass, general secretary of the Council. After explaining the legal aspect of illegitimacy Miss Fass points out the desirability of collaboration between statutory bodies which are in a position to provide the more material benefits of maintenance and medical care and the social worker who can act as guide, philosopher and friend. The question of voluntary homes for unmarried mothers is discussed and also the difficult problem presented by mothers who are mentally deficient. Since it is usually far from easy to secure admission for illegitimate children to children's homes the usual arrangement is for the mother to place the child with a foster-mother. With regard to adoption it is suggested that some infants with this end in view, are subjected to early weaning and changes of diet, probably a contributory factor to the disproportionately high death rate of illegitimate infants.

HEALTHY HOLIDAYS FOR THE WORKER

CONFERENCE AT SKEGNESS

A conference of the British Health Resorts Association attended by a large number of medical visitors from London and elsewhere was held at Skegness on April 17 when the subjects discussed were 'Industry and the Health Resort' and 'The Health Values of Sport and Sea Bathing'. This Lincolnshire resort, to the fortunes of which the Hassall 'So Bracing' poster largely contributed, was hospitality itself, though some of its attractions had to be taken for granted. It was claimed by various speakers that its hours of bright sunshine number 1,570 annually, that it is the centre of the driest belt of the British Isles that its average is only two gales a year, some ten fogs and some twelve snowfalls that its mean temperature the year through is only one degree lower than the average of the balmy South and that it is one of the eighteen towns in the British Isles where there is sufficient ultra-violet radiation to cause sunburn in December. Unfortunately a period of drizzling rain and shivering cold coincided with the visit and the "garden town" for the East Midlands was not seen at its best.

Lord MESTON the president of the Association in a foreword to the conference, said that since that energetic body was founded a few years ago it had shown that British spas, sea resorts, and mountain pleasantries comprised everything or nearly everything in health resources and enjoyment that could be found on the Continent. It was now on the threshold of another task to ensure if possible that the restorative value of our health resorts was accessible in organized fashion to the working-class as well as to those who were better off. It was a task which called for the co-operation of the local authorities in these places, the medical profession, the hotel and boarding house industry and the organizations of employers and employed.

Industry and the Health Resort

Mr ERNEST BEVIN general secretary of the Transport and General Workers Union said that this was one of the subjects which would engage the newly constituted joint committee representative of the Trades Union Council and the British Medical Association. One of the principal struggles of the trade union movement had been to establish as a part of the contract of service the right of work-people to holidays with full pay. The need for annual holidays was becoming more imperative with the intensification of industrial processes and the increasing wear and tear of modern life and public opinion was now ripe for a reform in the direction of holidays with pay. It had been amply demonstrated that the cost of holidays to industry was offset by the decrease in sick leave and absenteeism. One result of the extension of holidays for workers would be a lengthening of the holiday season, which would be spread more or less over the year, entailing a good deal of thought if the resorts were to be made enjoyable and beneficial in changeable weather.

The subject of convalescent treatment was also touched upon by Mr Bevin. At present, he said, convalescent treatment was provided in a very haphazard way. Trade unions and friendly societies had established convalescent homes but the selection and treatment were limited and the fullest possible benefit was not derived. There was a call for a co-ordinated plan shaped by the unions and societies on the one hand and the municipalities on the other whereby the health resort likely to be most beneficial to the person needing the convalescent treatment could be chosen and suitable arrangements made for the completion of the cure and for a pleasant and restful vacation in the best possible conditions. Another idea of Mr Bevin's was that the Government should be urged to set up a Royal Commission to examine the whole

problem of the planning, equipment, and co-ordination of health resorts

The need for more attention to the planning of the holiday for the industrial worker was also stressed by Mr A. L. PETERSON of Letchworth. It was necessary to popularize the idea of holidays being taken over periods other than what were now known as the holiday months.

Prophylactic Holidays

A very original and suggestive contribution was made by Dr LEONARD P. LOCKHART, medical officer of Boots Pure Drug Company, Ltd. of Nottingham. Dr Lockhart considered that the distinctions between the holiday-maker and the patient were too marked. It was the holiday atmosphere that counted most in both cases and it was a pity that people were not sent away far more often as a prophylactic receiving sick benefit and subject to no unreasonable restrictions. A fortnight at Skegness in selected cases would keep large numbers away from the insurance practitioner for weeks. There was still too much reluctance, he said, on the part of approved societies to send people away early rather than after long and debilitating periods of sick absence. His own firm had a home in Skegness and he believed that money spent on the right cases at the right time had saved months of idleness and much domestic and financial loss. The doctor in industry and the insurance doctor working together were able to select cases with a high degree of accuracy. If only small firms would pool their welfare resources and employ a doctor part-time to watch over their staff this doctor again in co-operation with the insurance doctor could by means of prophylactic holidays effect a great deal of good. If in addition some skilled but simple psychotherapy could be brought into play before the holiday another large class of potential patients might be helped over some critical phase and breakdown avoided. Dr Lockhart then went on to make a number of suggestions as to winter holidays: diet at resorts, the organization of the family side of the problem, the question of transport, and the aesthetics of holiday-making important also from a health point of view of which it is to be hoped holiday resorts and others concerned may take note.

In some further discussion on this subject Mr McADAM ECCLES said that the extension of the season during which health resorts could be used was essential. There was still a feeling that resorts were only for three months of the year. The difficulty lay in inducing the worker to believe that it was good to have a holiday at other than the orthodox time; that in fact the year is the season.

Health Values of Sport and Games

Sir KAYE LE FLEMING, a member of the National Advisory Committee on Physical Fitness (though he was careful to point out that he spoke in an individual capacity) opened a second session of the conference on the subject of sport and games. The subject he said was associated with the idea of leisure, a thing not well understood and requiring a good deal of education to make it enjoyable and profitable. It had two distinct aspects—relaxation after work and recreation in the true sense of the word. Games not only gave pleasure because of a competitive element but because they afforded opportunity for the development of skill or in other words the bringing out of the latent possibilities of the body. He described games as often the specialized ends of physical education or training. The training of the body to perform whatever tasks it was set was different from the test to which it was put in such a game as—to take an extreme example—Rugby football. Nobody would describe Rugby football as the ideal physical training without a preliminary training of many other kinds.

Some games were particularly suitable for the general training of the body—he gave lawn tennis, swimming, and

skating as examples. The disadvantage of some recreations such as cricket and football was the space they demanded but there were other games which could be played with less demand in this respect and with great benefit to the industrial populations. Badminton was of this description of extraordinary value in physical training and requiring very little space. Another game which might be very much more widely known and applied was deck tennis.

Sir KAYE LE FLEMING said also that he looked forward to the time when not only at seaside resorts but in all places especially where there were bathing facilities there would be a building which for want of a better name he would call a gymnasium not however fitted with fixed apparatus for different exercises and nothing else but a large covered building in which games could be played, physical training and exercises undertaken and music enjoyed. He touched briefly on other topics such as clothing in relation to exercise and work and with regard to sea bathing suggested that the scientific effect of light and sea water combined had not received enough attention from the medical profession. He was looking forward to the work of the new Advisory Council in establishing a college of physical training for men to afford facilities whereby various research could be carried out on physical education, fatigue, exercise tolerance and the like.

Sea Bathing

Dr R. COVE SMITH addressed the conference on sea bathing which he said had a tonic effect in promoting a healthy vascular co-ordination. The stimulus of the changing temperature, the alternation of douching and evaporation on the cutaneous nerve endings and other physical factors had a bracing effect provided it was not allowed to be too drastic at the beginning. The best time to bathe was between the hours of 10 and 5 in the day, preferably about two or three hours after a meal and when the tide was high. At first the bath should be short, measured in minutes and with children old people and invalids it should always be short. Those of more robust physique might lengthen the time and increase the frequency but this should only be done gradually. The early morning bath on an empty stomach before the body had regained its natural warmth could only be undertaken with benefit by the strongest and by those who had become acclimatized by long practice. Bathing in the night air was also to be deprecated. The ideal was to leave the water before the stage of primary reaction had worn off. At the end of the bath a period of rest was advisable and perhaps a sun bath. Dr Cove Smith ended with the record of some observations on the effect of bathing on blood pressure in trained and untrained subjects.

Dame LOUISE McILROY gave a brief address on the treatment of gynaecological affections at health resorts. For chronic gynaecological affections sea water baths and warm douches were excellent. Some cases of sterility were due to endocrine dysfunction associated with obesity and yielded to treatment by means of baths, exercises, and dieting. Intestinal stasis was responsible for many gynaecological and obstetrical complications. The loss of tone in the bowel with a sagging colon and defective support from the abdominal wall could be cured in many cases by colonic lavage baths and exercises. The Vichy bath was specially valuable with massage under warm water sprays. She also referred to the mental aspect of treatment at health resorts, many gynaecological and obstetrical affections being associated with neurotic states. Rest and complete relaxation with freedom from domestic worries did much to restore reproductive function.

The Skegness Urban District Council entertained the visitors to dinner on the evening of the conference. Replying for the British Health Resorts Association to the toast of its health, Dr ALFRED COX said that he believed that during its short life the Association had taught something of real value to the resorts. Many a

paces had been content to cater for the crowds who came to them during the holiday months but now the more enterprising were seeking to offer their advantages over a longer season and on a better organized system. Seven such conferences as the present had been held at different seaside resorts. Lord Meston fittingly acknowledged the hospitality of Skegness to which Mr J W CRAWSHAW responded in a speech describing some of the developments on this part of the Lincolnshire coast. He claimed for Skegness that its bathing pool was among the first half-dozen in the country its solarium was the first of its kind and its physical culture classes were inaugurated long before the national call for such training.

Those attending the conference also visited the National Deposit Friendly Society's convalescent home, one of nine convalescent homes at Skegness—a very handsome and pleasant building run on hotel lines and accommodating some 120.

HOME NURSING SERVICE

PROVIDENT SCHEME FOR GREATER LONDON

A largely attended meeting to inaugurate the Greater London Provident Scheme for District Nursing was held at Grocers' Hall on April 19. The scheme will make it possible for persons working in a place where five or more are employed to obtain nursing benefits at rates far below those hitherto practicable in London. Benefits will include free nursing care of contributors and dependants, subject to medical direction in the patient's home, also the loan of certain appliances. Midwifery and normal maternity work are excluded.

The EARL OF ATHLONE, president of the Scheme, said that he had followed with keen interest the efforts resulting in the setting up of the new organization and the growing sympathy and support it had received. London was served not by one but by scores of district nursing associations each drawing rightly much of its vitality and inspiration from the sense of local patriotism. But the economic way of operating a provident scheme was to avoid the laborious house-to-house collection and collect at the place where the contributors worked or were congregated. Only through a central organization acting as a clearing house for local bodies could a large scale provident scheme be successfully run in London. The new scheme aimed at providing a supplementary service for existing district nursing organizations to enable them to offer to the public at the lowest possible cost an extended and fully adequate supply of properly paid and equipped nurses. Once established the scheme would be self-supporting, although in its initial stages it might be necessary to seek to increase the generous financial backing it had already received. The scheme was already well sponsored in that it had been initiated by the wish of a substantial body of opinion among the associations concerned and had the active participation and support of the associations providing the great majority of the district nurses in the London area.

The Provident Principle

Lord HORDER, chairman of the council of the Scheme, said once it was accepted that the provident principle was right it might occur to others as it had to him that home nursing was the only health service which up to now remained uncovered by that principle applied in one form or another. Every health requirement was within reach of the ordinary wage-earner except that one service which in many cases made the greatest difference of all—the service of the district nurse in a patient's home. The provident idea was the same as that of insurance. A halfpenny a week—the actual basic rate proposed under the scheme—was within the means of any wage-earner. The reason why the amount was so small was largely because collection in bulk from a large number of workers at their place of employment could be done simply and at little cost. The provident or contributory method was popular

from the point of view of the contributor because whereas the demand for payment at a time of illness might come at a moment when family resources were already depleted the small regular weekly contribution was relatively little felt; also the weekly wage-earner preferred to feel that he was a supporter according to his means in normal times, of a service the benefit of which to himself and his family he was the first to appreciate.

From the point of view of the district nursing service itself nurses must be assured of a source of income independent of the incidence of sickness and which relieved them of the onerous task of acting as collectors. Wherever the provident method had been instituted on a large scale it had been the means of supporting an extended and better paid service. Lord Athlone had referred to the special difficulties of setting up a comprehensive scheme in London but like other difficulties they were not insuperable and it certainly seemed that the meeting had before it the right proposals for establishing and maintaining a very necessary service. The scheme was being brought forward at an opportune moment for the whole nation was believed to be becoming keen on physical fitness and it was hoped, might become keen on mental fitness also.

A Great Preventive Scheme

Miss M WILKINSON, general superintendent of the Queen's Institute of District Nursing, said that the patients who could be nursed at home were far more numerous than those requiring institutional care. Thus the trained nurse was essential in acute and chronic cases as a link between hospital treatment and the patient at home and also as a link between health authorities and the patient. Every district nurse in the county of London had received full hospital training and in most areas in the outer ring she was also fully qualified. When mention of district nursing had been made as applied to Central London it had often been asked: "But where are the patients who need nursing?" That indicated little realization of the back streets or tenement dwellings where there were thousands of families in need of nursing. For the carrying out of the scheme there must be some centralization of the collection which would enable contributors to be nursed in any part of Greater London in which they might live. The employment group suggested by the Greater London Provident Scheme as a basis of its work was therefore the simplest and most effective solution. The scheme would prevent those subscribing from having any reluctance in calling in a nurse for fear of additional expense. Hundreds must now be muddling through illnesses. The scheme would undoubtedly be a great preventive agent. Moreover because skilled care would be given to the small beginnings of illness serious complications would in many cases be avoided. Employers would surely realize the importance of that. With increased income the district nursing associations would have the opportunity for which they had long waited of extending their service and improving and enlarging the accommodation for the extra nurses they so badly needed. In view of the steps being taken to ensure a fitter Britain the preventive work done by the district nursing service was becoming of increasing importance.

The February issue of the *Bulletin de l'Office International d'Hygiène Publique* contains articles by Dr Sven Gard on *formes frustes* of poliomyelitis in Sweden, cerebro-spinal fever in the British Colonies in Africa, by Sir Thomas Stanton, cerebro-spinal fever in the French colonies in Africa by Inspector-General Sael, human infection by *Leptospira icterohaemorrhagiae* by Professor W A P Schüssler and Miss B Welch, Sordrager, spirochaetosis, icterohaemorrhagica in Poland by Dr W Chodzko, frequency and forms of tuberculosis in man caused by the bovine bacillus by Professor I Lange, incidence of human tuberculosis of bovine origin in Great Britain by Sir Weldon Dalrymple-Champneys, frequency of human tuberculosis due to the bovine bacillus in Scotland by Dr M T Morgan, frequency of tuberculosis of the bovine type in Holland by Dr A Charlotte Ruyss, and an English memorandum by the Ministry of Health on sterilized surgical catgut.

Reports of Societies

MENTAL DISORDER FOLLOWING HEAD INJURY

At a meeting of the Section of Psychiatry of the Royal Society of Medicine on April 13 with Dr T A Ross in the chair Dr C P SYMONDS introduced the subject of mental disorder following head injury confining himself to the effects of closed injury (that is injury without compound fracture) and excluding any reference to the effects of focal lesions or to mental disorder associated with traumatic epilepsy.

Dr Symonds said that the outstanding symptom in the cases under consideration was loss of consciousness in some degree. The duration of the loss of consciousness was most conveniently measured by that of the traumatic amnesia. He considered first the case of minor head injuries the so-called concussion. The recovery of consciousness might be extremely rapid but however rapid there was a transition from deep stupor to a state of dazed bewilderment, and after this automatism before full consciousness was regained and the amnesia would often be found to include some utterance or action which had appeared as conscious to the bystander. Occasionally the loss of consciousness after the injury might be delayed. The patient might remember the accident and the events immediately following it and afterwards relapse into a state of automatism which might last for several hours.

After an exceptionally severe injury the progress of recovery to full consciousness might be spread over a period of days, weeks or even months. The mental disorder after the minor injury might be dismissed as the after-effects of concussion and that after the severe injury regarded as acute traumatic psychosis but he believed there was no essential difference between the two though the latter condition with the more or less regular sequence in the symptoms from stupor to confusion and finally to a state which resembled Korsakow's psychosis afforded an opportunity for detailed analysis of the traumatic mental disorder. He preferred to consider traumatic psychosis as a whole recognizing in its course the predominance of one or other symptom—in the early stages stupor, later confusion and after confusion had faded into the background defective memory of recent events and a tendency to confabulation. The state of deep stupor was associated with restless bodily movements but without speech and without any response to internal or external stimuli above the level of the simplest alimentary, excretory, and protective functions. This might last for a few days though he had seen one case in which stupor of that degree lasted for as long as eighty five days, with recovery.

State of Confusion

When the patient emerged from stupor he was as a rule excited and acted in a resistive irritable way to outside stimuli. The state of confusion often with delirium might last for days or weeks with an occasional relapse into quite deep stupor. At the stage when the patient began to be accessible the salient features were profound disorientation in space and time with a tendency to interpret the immediate surroundings in terms of long past experience. There was defective perception, memory and judgement were grossly impaired and there was conspicuous disturbance of the speech function. A far reaching retrograde amnesia was noteworthy. Perseveration was one of the most striking features in this form of disorder.

The disturbance of speech function in this stage attracted the attention of the neurologist. After the first return of speech there was often a considerable amount of talk in which words and phrases were well formed but unrelated to one another or to the circumstances. Afterwards the spontaneous talk began to have some general

relation but was still in part meaningless. In this phase the patient's attention could generally be gained for a moment or two but his responses were inaccurate and often so distantly related to the question or request as to seem quite at random. Comprehension of the written command generally seemed to return later than that of the spoken command possibly due to the fact that the written sentence was less quickly appreciated.

Later Stages of Disorder

The transition from the state of confusion to the state resembling Korsakow's psychosis was a gradual one. There was a tendency for the patient always to confabulate when pressed for information and this persisted at a time when his behaviour in relation to hospital surroundings and his speech in simple conversation no longer showed confusion though impairment of memory and of insight and judgement remained. The confabulation might take the form of false accusations in relation to the accident.

The Korsakow state was a constant feature of the later stage of every prolonged traumatic psychosis. Gross defect of memory for recent events remained the outstanding symptom sometimes for a long period. Occasionally there was a rather childish petulant depression but the commonest abnormality appeared to be undue elation. The ending of the Korsakow state was not by any means clean cut. After the tendency to confabulate had disappeared there was generally a period with defective insight and judgement and often gross defect of attention. Notable was the patient's refusal at this stage to admit anything wrong with him and to talk in a light hearted way about the accident even though it had involved the death of a relative or friend.

The prognosis for the acute traumatic psychosis appeared to be invariably good whatever its duration. The longest case of which he had a record was that of a man of 67 who still showed some confusion and grossly defective memory fourteen months after his accident but a month later was quite clear and although having some residual deterioration of intellect and personality was able to manage his own affairs. He had two other cases of patients over 60 who made comparable recoveries so that it looked as if the pathological changes whatever they might be which were responsible for the whole sequence of mental disorder so far described were reversible at any rate to the point of allowing restoration of function under normal conditions. These cases of severe injury provided a slow motion picture of the mental disorder which followed minor injuries. After the minor injury the phases of stupor, confusion and amnesic automatism followed one another with such rapidity that the whole sequence was over in a few minutes.

compensation with its attendant worries often bulked largely in environmental stress. The tendency always was towards recovery.

All the most comprehensive studies of mental disorder following head injury had included some reference to the precipitation of a specific mental illness. In persons of a paranoid, schizoid or manic-depressive constitution a psychosis of the appropriate type might be precipitated by the injury. There were two ways in which the effects of an injury might contribute to such a development. In the first place one of the symptoms in the state of post-traumatic dementia was exaggeration of pre-existing traits and in the second place the injury created a situation of incapacity and invalidism to which the patient reacted in terms of his individual make-up. There appeared to be a special liability of this kind in the case of manic-depressives.

Traumatic Neurasthenia

Dr Symonds added that he could not leave this subject without saying something about traumatic neurasthenia following head injury. Why was traumatic neurasthenia so called more commonly found after head injuries than after injuries to other parts of the body? He suggested that the patients liable to this condition after head injury fell into three groups: (1) those in whom the injury had released a pre-existing disposition to illness of the depressive invective type, (2) those who were incompletely recovered from post-traumatic dementia, (3) those who were suffering from psychogenic illness. These last might be regarded as suffering from neurasthenia which was traumatic in a physical rather than in a psychogenic sense.

Attempts had been made to explain the pathology of acute traumatic psychosis in terms either of increased intracranial pressure or subarachnoid haemorrhage. He believed that neither of these theories could be accepted but he had no alternative pathology to offer except the old and vague conception of direct molecular damage. He had one generalization in which he desired to indulge in conclusion. The later effects of head injury could properly be understood in the light of the full psychiatric study of the individual patient and especially of his constitution—in other words it was not only the type of injury that mattered, but the kind of head.

A Subjective Study

The PRESIDENT said that about eighteen months previously he had had the good fortune to be thrown from his horse and to have a slight concussion. He had a number of memories of his confusion state which he carefully set down in writing three hours afterwards. He remembered sitting on the ground in a familiar landscape though he did not know where it was. It was very cold the wind was blowing and there was a babel of voices above his head. He also remembered looking at a haystack and had a very strong recollection that he hated the colour of it. Then he remembered walking in the road with a young man to whom he was extraordinarily polite whereas the testimony of a niece who was with him at the time was that immediately after the accident he was the very reverse of polite. It was evidently an instance of selective memory similar up to a point to that which occurred in dreams where the impressions were consecutive, but not in the least consequential.

Dr THOMAS TENNENT gave a study based on 44 patients who had been admitted to Maudsley Hospital during the period 1923 to 1936 each of them suffering from a psychosis following a head injury and their stay in hospital ranged from two months up to in one case two years. During the first eleven years of the period only twenty-six such cases were admitted and during the last three years eighteen suggesting that such cases were on the increase. Four of the cases proved to be general paralysis and these would not be further considered. Of the remainder the initial symptoms were more or less the same in all—con-

fusion, varying degrees of irritability and depression, disorientation, and gross memory disturbances. In five cases, when the degree of confusion became less marked, hallucinatory experiences and bizarre or paranoid delusional ideas became prominent. There was evidence that two of these patients had had previous hallucinatory experiences neither of them showed any permanent improvement. In seven other cases the form of illness became depressive in nature of these four had now recovered from the psychosis one was still in a mental hospital one was dead and one untraceable. There were three cases in children under 16. There remained twenty-five patients in whom the form of the illness was attributable solely to the accident and no other factor could be determined. All had marked impairment of memory. Two of them who had seen active service during the war showed a remarkable antedating, maintaining that the war was still on and furnishing details of their adventures. One patient died in hospital and of the other twenty-four so far as it was possible to ascertain their present condition ten had recovered, nine had improved, two were in mental hospitals, two were untraced and one was dead. Those in the 'improved' group suffered sometimes from pains in the head and lack of ability to concentrate and make a decision.

Retrograde Amnesia

Dr EDWARD MAPOTHER said that Dr Symonds in this brilliant piece of clinical psychiatry had identified the amnesia which there might be for a period following the accident with the unconsciousness which supervened immediately upon the accident. He rather doubted whether that was justifiable and he quoted a personal experience. Everyone knew of accidents on the football field in which the player who had been kicked on the head carried on automatically until the end of the game. Once while he was a medical student he received a kick on the head while playing football and when he came round he found to his surprise that he was playing in the opposite direction to that in which he had played before losing consciousness. He had always assumed that following the kick on the head he had played reasonable football in an automatic way, and had changed over with the others at half time. But now he was not at all sure that he did not receive the kick considerably later and after a very brief period of unconsciousness woke up with a retrograde amnesia extending over the previous ten or fifteen minutes. It was very important to study the gradual emergence through stupor to confusion and the automatic stage of Korsakow's psychosis.

Professor HUGH CAIRNS said that there was still a great deal to be done on the pathological side especially in relation to acute psychosis. It was an extraordinary thing that this reversible process could exist for ten months with complete recovery. He had seen the condition come on in a man about five days after the head injury, at the time when he developed sepsis or cellulitis from other injuries and it persisted until the sepsis disappeared. He had seen it also persist with the use of barbiturates and cease when these drugs were withdrawn. It was remarkable that a man might have a certain amount of damage to his brain and yet be able to celebrate quite well until some toxic process began or some excess of barbiturates was taken, which caused or maintained the psychosis.

General Discussion

Dr W. F. MENZIES mentioned several interesting cases in his experience. One was that of an old school fellow who was hit on the head by the boom when waching on the Clyde. After the injury although it was eighteen years since he had left school during which period he had never looked at Greek he was able to repeat correctly *fifty lines of the Odyssey* and other reputation exercises which he had learned in his school days. The speaker thought that there was a molecular dissociation in these cases followed in the chronic condition by a fibre-

Dr ERIC GUTTMAN drew attention to some observations on bovers, saying that there was sufficient reason to suppose that the transient disturbance of consciousness owing to a knock out was functional, and that there was no structural brain damage. Dr A. A. W. PETRIE said that Dr Symonds had used the term "post-traumatic dementia." Did they all mean the same thing when they used that term? He suggested that some of the cases cited by Dr Symonds were rather of the order of post-traumatic instability of the kind which showed itself more commonly in the young. Would not that term more fittingly describe many of these cases rather than post-traumatic dementia such as one saw occasionally in the analogous condition of alcoholism?

Dr PURDON MARTIN said that there were a number of people who went into dementia after having made apparently a fair recovery from the accident. He recalled the case of a railway man who had a severe injury from which in the course of a few months he recovered sufficiently to go back to work, but after a further month or two gave it up again and then deteriorated mentally fairly rapidly and became at length profoundly demented. Dr Symonds had referred to the symptom of elation in some of these cases with which confusion and loss of memory were associated. He was inclined to regard the elation as more or less a focal symptom, because it was a symptom often seen in frontal lobe lesions, and recently it had been seen in cases in which surgeons had carried out daring operations on the frontal lobe. It was very uncommon for such patients to pass into an anxiety depressive state later on.

Dr CLIFFORD ALLEN asked whether it was possible that in these cases of head injury the details of the accident were not retained in the mind but the victim kept dreaming of them. Dr HENRY WILSON said that what they tended to forget about head injuries was that the stage of acute confusion might last very much longer, though in a very slight degree, than was supposed. He had seen one or two cases in which apparently the patient had been held to be conscious and not confused, whereas actually he had had a very grave degree of confusion.

PSYCHOLOGY OF PUBERTY

At a meeting of the Medical Society of Individual Psychology on April 8 Dr H. CRICHTON MILLER discussed puberty and adolescence. This was the fourth and last lecture in the symposium on mental health in childhood and adolescence, the previous addresses having been delivered by Dr Joyce Partridge, Dr Emmanuel Miller, and Dr Margaret Lowenfeld respectively.

Dr Crichton Miller began by likening adolescence to an escalator. The element of inexorable physical development was in its way, precisely comparable to the relentless physical cadence of senescence. From the low level of childish inadequacy the individual was carried to the level of adult adequacy only to come down again as the generative life closed, to the inferior level of senescent inadequacy. On this moving stairway some adolescents were so eager that they walked, or even ran so that the development of their character outstripped their physical growth. Others hung back and showed a regressive attitude so that the growth of character was retarded when compared with their physical development. But to the child's mind the central factor was that this physiological growing up was an inexorable process in which were involved certain highly important principles of human life. Already familiar to the average child was the first of these principles—that of sharing valuation. In nursery and kindergarten schools he had already been taught or should have been taught, that he was not the only pebble on the beach, that his fellow creatures preferred a child who was not self assertive and obtrusive and that friends were made on a basis of mutual affection and respect. All through adolescence this broad lesson

constantly confronted and challenged him but a still more crucial and narrow application of this principle was going to present itself. It was that in adult life self-realization both biological and spiritual, would always be a problem in reciprocation.

Puberty and Sex

At puberty the child's outlook on the sex problem was variable. The most constant thing about it was that it was rarely what the adult imagined it to be. Probably the average child's only interest was to know whether the subjective experience of early physical gratification was to be left behind with childhood, or whether it would persist through adolescence and in adult life. Whether it was to be a secret or not or whether it would cause him to suffer condemnation or reproach.

Dr Crichton-Miller then went on to describe the different attitudes of male and female adolescents in relation to hysteria and anxiety. Cases were quoted to illustrate the repressions in adolescence of sexual problems. The adolescent was necessarily in a transitional state and the function of this difficult period of life was to work out an adjustment between the dependence of childhood and the independence of adult life, between irresponsibility on the one hand and responsibility on the other, between the security of child life and the adventure that was the zest of adult life, between the suggestibility of youth and the responsible judgement of the grown man.

SUDDEN DEATH

At a dinner-meeting of the West London Medico-Chirurgical Society on April 9, Mr NEIL SINCLAIR presiding, a discussion on sudden death took place.

Dr B. T. PARSONS SMITH in opening confined his remarks to cases in which sudden death was due to natural causes. As a matter of practical experience it had been found that the risk of sudden death was most common in such conditions as disease of the aortic valves, specific aortitis, angina pectoris, coronary atheroma and in acute and chronic myocarditis. Various theories had been put forward in explanation of the occurrence of sudden asystole in these diseases. The modern trend of thought, which, incidentally was confirmed by electrocardiographic study associated sudden death with the development of ventricular fibrillation, which was believed to be a possible complication of all the different types of heart disease. It was further suggested that fibrillation might be the cause of sudden death in patients with cardiac disease following what might appear to be a faint. This was very probably the explanation of the unexpected fatalities which at times followed trivial accidents, sudden shocks, and painful or other stimuli. Sudden death after haemorrhage was a well-recognized possibility in the later and complicated stages of certain diseases in some the actual loss of blood might be responsible for the sudden fatality. Dr Parsons Smith also dealt with other vascular accidents including arterial embolism and thrombosis. Thrombosis he said should always be included as a potential cause of sudden death. The condition was usually secondary to slowing of the blood stream in the diseased vessel.

Anaesthetic Deaths

Dr EDWIN SMITH, coroner for the Western District of London, said that often not in London but in country districts the post-mortem examination did not disclose the cause of death and that was very often the case when one had to take the opinion of people who had not had practical experience in pathology. Sometimes the coronary arteries were never examined, the cerebellum was missed entirely and the stomach might not even be opened. Again, errors might occur from sheer ignorance.

on the part of the person conducting the examination. In deaths occurring under an anaesthetic his own practice was not to consider that such deaths necessarily called for an inquest, but he was guided very largely by the desire of the relatives. A sharp distinction should be drawn between death due to an anaesthetic and death occurring while the patient was under the anaesthetic. With regard to the question of reporting a sudden death to the coroner the legal position was nebulous. There was no Act of Parliament requiring a doctor to report certain deaths to the coroner, the legal compulsion being on the registrar of deaths but it was customary for the doctor to make the notification.

Dr T SKENE KEITH said that in 800 recent necropsies all performed at the request of coroners the causes of death were found to be cardiovascular disease in 60 per cent, pulmonary disease in 8 per cent, intestinal disease in 2.5 per cent, diseases of the nervous system in 1.5 per cent, and renal disease in 0.5 per cent, while "special conditions" accounted for 6 per cent and external agencies for 21 per cent. Of the external agencies, accidents and suicides represented about two-thirds and pathologically were of little interest, surgical operations accounted for just under a quarter of these deaths. No pathologist could avoid the conviction that there was a condition in which enlarged lymphatic glands, enlarged lymphoid follicles, an enlarged thymus, a lymphoid spleen, and often an enlarged thyroid were associated with sudden death; this was often seen in children who died under an anaesthetic.

NEOPLASM OF THE COLON

At a meeting of the Manchester Medical Society on April 7 Dr S W PATTERSON (Ruthin Castle) reviewed eighty-two cases of new growths of the colon and rectum.

He said that Sir Edmund Spriggs had during the last few years analysed the admissions to Ruthin Castle of patients with diseases of the colon and had collated and published papers on diverticulitis, ulcerative colitis, and functional disorders of the colon. Of the eighty-two cases of cancer of the colon and rectum the colon was involved in sixty-eight and the rectum in fourteen. Two-thirds of the patients had been men. Their average age was 62 years, 64 in the case of men and 57 for women. The age of most lay between 50 and 70, five patients were under 50 and eight were over 70. The sigmoid and pelvic colon were the parts of the colon most affected. The length of history ranged from a week or two to three years, but was usually a few months. The lesion was sometimes well advanced before it caused any sign or symptom. The symptoms at onset were divided into five main forms: (1) increasing constipation, (2) irregular stools or looseness of the bowels of the colonic type, (3) pain usually above or below the navel but occasionally in the back, thighs or rectum, (4) upper abdominal discomfort or nausea, sometimes related to food—dyspeptic onset, and (5) the early passage of blood from the rectum. There might be an overlapping of two types of onset in the same patient. In some cases the onset was insidious. The bowel symptoms were almost negligible until some other condition led to the investigation of the digestive tract; recurring lumbago in one patient was found to be due to a secondary growth in the bodies of the eleventh and twelfth thoracic vertebrae which had originated in a carcinoma of the descending colon. In the fourteen cases of carcinoma of the rectum the age at the onset of symptoms ranged from 37 to 75 years. The symptoms of onset were described as a frequent desire to stool or diarrhoea in eleven, constipation in two, and increased epigastric pain after meals in one. Only two patients had noticed no blood in the motion, five had suffered serious loss of weight, and in one man pain

with micturition had been an early and troublesome complaint.

In the diagnosis the triad of constipation, more or less associated with diarrhoea and haemorrhage, was characteristic but only half of the patients with cancer of the colon complained of serious constipation and constipation might be present in ordinary intestinal stasis. Bleeding from the bowel occurred in 60 per cent of the patients and was not seldom ascribed to piles. Among the general symptoms loss of weight and anaemia were predominant. The anaemia might be severe in cases of carcinoma affecting the proximal colon without much obvious blood appearing in the motion, whereas when the growth involved the distal colon and blood and mucus were common, anaemia was not a prominent symptom. In all cases rectal and sigmoidoscopic examinations should be made. The patients might thus complain of dyspepsia or general malaise, usually with colonic symptoms, constipation, diarrhoea, pain, stoppage or haemorrhage but there was always a change in the character of the motions.

The radiological diagnosis of new growth was illustrated by a series of x-ray photographs and diagrams. In differential diagnosis the age factor had to be considered. Full discussions of the treatment from the surgical point of view had been published in the weekly medical journals during the last few years by Wilkie of Edinburgh, Devine of Melbourne, Rayner of Manchester, and Martin of London. In the present series excision was undertaken in thirteen of the cases of colon carcinoma and two of carcinoma of the rectum. Colostomy was performed in fifteen and ten cases respectively, while a short-circuit operation without removal had proved possible in nine of the colon cases. A consideration of the length of history with the results of surgical treatment showed that if advice had been sought earlier and a diagnosis made many more lives could have been saved.

In the subsequent discussion Dr LUXTON (Professor MORLEY), Mr RAYNER and the President (Mr GARRETT WRIGHT) again stressed the importance of early diagnosis and attention to the commencing disturbances of the bowel.

Local News

NEW ZEALAND

[FROM OUR CORRESPONDENT IN WELLINGTON]

Royal Australasian College of Surgeons

The annual scientific meeting of the College was held at Auckland from January 19 to 22. The first meeting was in the Town Hall and was addressed by Viscount Galway. The incoming president, Sir Louis Barnett, delivered an address and the fifth J. A. Syme Oration was given by Professor Hercus on "Prevention and Research in Relation to Surgery." The meetings may justly be called a course of intensive study during full morning, afternoon, and evening sessions. So many papers were read that there was little time for discussion. Orthopaedics was included in the general surgery section and ophthalmology constituted a separate section. Papers of more than ordinary importance were read by Sir H. Devine on "Advances in the Surgery of the Rectum," J. A. Bennett on "Lobectomy," and Miller and Coates on "Surgery of Head Injuries," while Royle introduced some new operations. The epidioscope, the lantern, and the film reduced the actual reading of the papers to a minimum. On general questions the discussion of apprenticeship in surgery took a prominent place and it became evident that conditions of hospital appointments and organization are quite different in Australia and New Zealand and are far from uniform in the different States.

of the Commonwealth. In Victoria the hospital system is more nearly comparable to the British system, but generally the honorary appointment is rapidly losing ground. It is more applicable to the situation, at least in New Zealand to advocate a visiting staff rather than a purely honorary staff.

British Medical Association

The biennial conference of the New Zealand Branch of the British Medical Association was held in Wellington from February 23 to 26 under the presidency of Mr. T. D. H. Stout. Sir Edmund Spriggs attended as a representative of the parent Association and also as a delegate from the Royal College of Physicians. He addressed the meeting on 'Diseases of the Colon: their Diagnosis and Treatment' and his address was illustrated by very striking and instructive x-ray films. Sir Edmund spoke also on the subject of coronary disease. Sir Robert Muir of Glasgow delivered an address on 'Paget's Disease of the Nipple,' bearing on his outstanding investigations into intraduct cancer. He showed on the screen a large number of photomicrographs revealing consecutively the various stages of development of Paget's disease of the nipple. As is well known he believes that cells can be malignant for a long time before they infiltrate, for infiltration is a secondary effect of cancer. His slides illustrated the changes not only in the epithelial cells but also in the connective tissue. His views lend support to the belief that malignant changes are the result, at least in part of endocrine disturbances. Another visitor was Dr. F. G. Morgan of the Australian Commonwealth Laboratories who spoke on the intravenous use of therapeutic sera, and also contributed notes on the use of serum in poliomyelitis. The Hunterian Gold Medal was presented to Dr. F. O. Bennett, this honour coming for the first time to New Zealand.

National Health Insurance

The Government has decided to introduce in the next session of Parliament a national health service, and a Parliamentary Committee is now considering the British system and also taking the evidence of witnesses. This subject came before the Conference of the New Zealand Branch of the British Medical Association which was asked for advice by the Ministry of Health. There was little or no discussion in open meeting but a committee of the Association has given serious consideration to the question. A political section in Parliament appears to favour nationalization of the medical profession but the consensus of opinion in the medical profession is against nationalization and in favour of a modified scheme of national health insurance. Though they considered that adequate provision for a full health service should be made available for those not able to make financial provision for themselves members of the National Health Insurance Committee of the New Zealand Branch of the British Medical Association favoured the view that any scheme embracing a large section of the community is neither necessary nor desirable. To quote the finding of the B.M.A. Committee:

By all means let the State ensure that no necessary medical service shall be unattainable by anyone from reason of lack of ability to pay for it. By all means let the heavier costs be so spread that no one will be crippled financially by major calamities of sickness, but leave to those who can meet their own costs the responsibility of meeting their needs in their own way and to their own satisfaction. Let the State concern itself more particularly with building a healthy virile race which cannot be done by running to the doctor and leaning on the State but by education, disease prevention and encouragement of self-reliance.

These sentiments are reminiscent of Macaulay and appear sound but may not be practical in these times. In the meantime the doctors may extract whatever comfort they can from the assurance of the Government that it does not contemplate any scheme which will react

detrimentally on the profession either as regards its earnings or its professional standards. But what actually does it contemplate? We must wait and see. The British system of national health insurance cannot be applied unmodified to New Zealand. In this Dominion there is no shortage of doctors and certainly no shortage of hospitals, the standard of living is very high and the sick in all classes of the community expect and will exact close and skilful individual attention.

IRELAND

The Need for a National Serum Institute

At a meeting of the Section of Medicine of the Royal Academy of Medicine in Ireland on April 2 Dr. C. J. McSweeney opened a discussion on the need for a national serum institute in Ireland. He pointed out that all the different varieties of sera and other biological products used in the prevention and treatment of infectious diseases had to be imported from abroad, a most unsatisfactory arrangement in view of the fact that a national emergency elsewhere might lead to a grave shortage of supplies in the Irish Free State. Moreover, sera prepared from strains or organisms prevalent in other countries could not be expected to be as potent against the local dissimilar strains. The case mortality rates for diseases such as diphtheria and cerebro spinal fever were consistently higher in Dublin than in cities across the water even when similar methods of treatment and dosage were employed. Elsewhere such serum institutes had proved beneficial, they were not conducted on profit making lines and they served also as centres for research into problems related to serum therapy and prophylaxis. Such an institute could most usefully be organized in connexion with the new Dublin fever hospital scheme: there would be adequate land available for the grazing of the necessary animals, and a great wealth of bacteriological material would be obtained from the wards. In it there could be prepared a good supply of human sera for the prophylaxis and treatment of virus diseases such as measles and anterior poliomyelitis and there would be enough convalescent donors to provide sera for private medical practitioners, a procedure which had hitherto been found to be impossible in most European countries. The administration of measles immune serum to the children of the poorest classes would materially lessen the mortality from this disease without requiring hospitalization of the patients. Commercial firms had not the facilities which such an institute situated in the grounds of a fever hospital would enjoy. Dr. McSweeney thought it essential that the institute should be linked closely with the newly formed Medical Research Council and the Irish medical schools. A specially qualified medical director, who was experienced in serology, should be in charge and young graduates should be given facilities to conduct investigations of the public health problems peculiar to the Irish Free State. The institute would not undertake the routine work of bacteriological examinations: it would not be given a monopoly of the manufacture of sera for use in the Free State nor would it attempt to compete with the many reputable commercial firms which marketed their biological products there. Its function would be to conduct research into biological problems generally and to prepare human immune sera for use especially by dispensary doctors particularly in the homes of the poor and by orphanages and similar institutions which had no facilities for manufacturing their own supplies. The institute might be financed out of the hospital sweepstakes funds which were not necessarily wholly earmarked for the building and equipping of hospitals. Professor J. W. Bigger remarked that such an institute might well become a centre of education, research and propaganda, while it would reduce the adverse trade balance of the country, give employment and teach medical practitioners the value

of diphtheria prophylaxis. From the financial point of view little would be gained. The institute should be free from State control, which would tend to narrowness of administration and outlook as well as to undesirable attempts at undue economies. Professor Henry Moore, who for three years had been conducting a large serum institute at the Rockefeller Institution which supplied pneumococcal sera throughout the world, said that it was not very difficult to run such an institute if the help of sufficient technical experts could be obtained. Before deciding on its establishment in the Irish Free State there should be a careful preliminary examination of the business aspects, since it would almost certainly not prove to be commercially successful. It should not be controlled by the Medical Research Council, but should gain useful constructive advice from it. Professor Abrahamson thought that further examination of the whole question was necessary. If it could be proved that the increased mortality from diphtheria could be combated by the local preparation of serum such an institute was then a necessity, whether self supporting or not. Dr V M Synge remarked that in Ireland the cases of meningial infection were sporadic, and so the mortality was higher than in England where cases were epidemic. Professor W D O'Kelly agreed that with a population of only three millions the establishment of such an institute could not be economical though from the point of view of research it was most desirable. Dr W R F Collis stressed the necessity for the supply of measles serum and thought that the institute could be best started in a small way in connexion with the new fever hospital, but not as a State venture. Dr J C Flood was sure that the State would not consent to financing such an institute without some measure of control of it. He deprecated dependence on one serum production centre alone and indicated the advantages of permitting competition. Dr McSweeney replied that in Cork Street Hospital with its 300 beds between £3 000 and £4 000 was spent annually on sera and that probably the expenditure in this connexion in the whole country amounted to at least £20 000. To run a small institute would not cost more than £10,000 a year. The diphtheria mortality in Dublin could be much reduced by using better brands of sera and the measles mortality could be almost abolished. There must be no monopoly as regards the conduct of the institute, it should be controlled by medical practitioners and not run for profit.

ENGLAND AND WALES

A Centre of Physical Medicine in London

The Institute of Ray Therapy and Electrotherapy in Camden Road, N.W., which was established about eight years ago for the assistance of people of small means who cannot afford physical treatment in the ordinary way, is appealing for £25 000 by the end of the present year. The object of the appeal is to secure more space for its crowded work, to treble the equipment and accommodation of the electrotherapy department and to make the Institute a centre for physical fitness with classes for remedial and corrective exercises combined with light baths—in fact a London spa—a home of physical medicine in the heart of the capital. To commend this plan to the sympathy of the Press a luncheon was given at the Institute on April 19 with Lord Horder, the president of the Institute in the chair. Lord Horder said that a great work had been done in this Camden Road hospital during the last eight years and he commended in particular the proposed enlargement on the electrotherapeutic side. Electrical methods in treatment were some two hundred years old—not nearly as old of course as massage or hydrotherapy—but they had been obscured by a spate of new discoveries in the direction of what was generically called ray therapy. Electrotherapy had thus become the

Cinderella of medicine, and he applauded the effort to be made by the Institute to restore it to a more dignified place. The Institute, with its Medical Advisory Committee under the chairmanship of Sir Robert Stanton Woods, provided up to date equipment and a staff expertly trained. There was much indiscriminate use by untrained people of old-fashioned machines—really a form of quackery by which the public was exploited. A type of pseudo scientist was accustomed to go round an apparently well-equipped room and turn on one switch after another in the hope that at last the patient would say he felt better. Lord Horder also welcomed the Institute, especially with its projected extensions, as a strong ally in the campaign against that crippling and disabling group of diseases called rheumatism. Lord Semphill, chairman of the governors, described the work in more detail. The conditions treated, he said, included rheumatism and kindred diseases, the after treatment of accidents on discharge from hospital, the prevention and cure of children's diseases such as rickets, also skin diseases, nervous disorders and diseases of ear, nose and throat. The Institute was giving nearly three thousand treatments a week, the number of new patients—2,344 last year—was growing rapidly, and there was evidence of the real need of this form of treatment in industrial London. Miss Violet Vanbrugh added a few sympathetic words about cases known to her which had been benefited at the Institute, and Mr Russell Howard, a member of the Medical Advisory Committee underlined the appeal after which, under the guidance of Dr William Beaumont, honorary physician and medical director, and Mrs Beaumont, honorary secretary, the visitors made a tour of the building. The equipment includes all forms of ray therapy, infra red rays, radiant heat, ultra violet and r rays diathermy, including the new 'short wave' galvanism, faradism, sinusoidal currents, ionization and Schnee baths. More impressive still was the sympathetic handling of the patients, especially the child patients, for whom something of a playroom atmosphere is provided. The patients all come on a certificate from their own doctors, and pay what they can afford.

Advisory Committee on Scientific and Ancillary Mental Health Services

The Board of Control with the approval of the Minister of Health has appointed the following to be a committee to advise upon questions arising in connexion with scientific and ancillary mental health services. The Earl of Radnor (chairman), Sir Laurence Brock, Sir Hubert Bond, M.D., Alderman J W Black, Alderman W E Loysey, Dr A A W Petrie, Miss Adeline Roberts, M.B., Alderman J C Grime, Dr C J Thomas and Dr George Somerville with Mr H J Clark as secretary. A committee was appointed in 1931 but owing to the financial crisis which occurred in that year its work remained in abeyance. The Mental Treatment Act 1930 empowered local authorities to provide for out patient treatment and for the after care of mental patients and subject to the approval of the Board of Control to undertake or contribute towards the expenses of research in relation to mental illness. The primary function of the Advisory Committee will be to advise the Board of Control regarding organization and encouragement of research and other ancillary services will be within its purview. On technical questions relating to research the committee will have the expert assistance of members of the Committee on Mental Disorders, of the Medical Research Council.

The Isle of Wight Mental Clinic

Some five years ago the Mental Hospitals Committee of the Isle of Wight County Council established a mental welfare clinic for out patients under the Mental Treatment

Act, 1930 The result, as outlined in the report of the medical superintendent of the county mental hospital, Dr C Davies Jones, has been very encouraging The clinic meets at Cowes, Newport and Ryde approximately every week, and at Whitecroft (the county mental hospital) about every fortnight In 1936 there were in all 211 patients, including thirty nine under 16 The medical superintendent indicates the disadvantages of trying to deal with children and adults together and hopes for the establishment of a child guidance clinic He regards the work with potential suicides as most important and hints that the recent fall in the incidence of suicide on the island may be due in some measure to the help which the clinic gives to persons whose anxiety and misery are overcoming them The Ryde sessions are held at the county hospital and the Newport sessions at premises in the town, so that the clinic is an interesting example of the three different systems which are advocated for out-patient clinics—namely in conjunction with the general hospital, with the mental hospital, and with neither

SCOTLAND

Lunacy in Scotland

The annual report of the General Board of Control for Scotland shows that during 1936 the total number of patients admitted to mental establishments (excluding transfers) was 2 564 130 fewer than in the previous year and 304 fewer than the average for the quinquennium 1930-4 The number of insane persons, excluding those maintained at home by their natural guardians, was 19 631 Of these 2 719 were privately maintained 16 821 were maintained from the rates and ninety one at the expense of the State The number of voluntary patients admitted to asylums was 900 and the total number of such patients resident on January 1 1937 was 1 327 Private patients discharged as recovered numbered 148, and pauper patients similarly discharged 842, these numbers being respectively 7 and 9 more than those for the preceding year There were 266 deaths of private patients and 1,116 of pauper patients the death rate for all patients having been 7.5, as compared with 7.3 per cent in the previous year Of the 147 patients discharged on probation sixteen were finally discharged as recovered, forty three returned to asylums and three died The report refers among other matters of general interest to the present shortage of asylum accommodation While extensions have recently been made or are in process of being made, at the Aberdeen Royal Mental Hospital the Crichton Royal Institution and the Montrose Royal Asylum, there is considerable congestion in several other institutions It is pointed out that admission is now taking place at an earlier stage of mental illness for while in the period 1890-4 the average number of persons in residence in Scottish asylums on a voluntary basis was sixty two the average number of such persons during the years 1930-4 was 1,069 The report expresses the opinion that generally speaking the mental hospitals throughout Scotland are medically under-staffed Wide variations were found to exist in different mental hospitals in regard to the ratio of medical officers to the number of patients—from 65 to 389 patients in residence per single medical officer It is suggested that the medical superintendent and his assistants should be regarded as specialists and that their time and energies should not be occupied in ancillary services—such as those of clerk of the works stewards farm managers and dispensers—while their services to the public outside the institutions to which they are attached would be of great value With regard to expenditure the returns furnished by local authorities show that for pauper lunatics a total sum of £943 616 was spent during the year and for aided mental defectives a further £264,106

Association of Physicians

The annual meeting of the Association of Physicians of Great Britain and Ireland was held in Edinburgh on April 16 and 17 The sessions for hearing scientific communications were held in the Music Classroom of the University, clinical cases and demonstrations of new methods were arranged in the wards and clinical laboratory of the Royal Infirmary On the evening of April 16 Sir Robert Philip presided at the annual dinner of the association which was held in the hall of the Royal College of Physicians

Falkirk Infirmary

At the annual meeting of the Falkirk and District Royal Infirmary the report submitted for 1936 mentioned that two serious problems had arisen the provision of additional accommodation for inpatients and the obtaining of an income necessary for the ordinary maintenance of the Infirmary The managers had therefore resolved to proceed with an appeal for £40 000 which would be used for the erection of a new nurses home capable of later extension, which would set free for the reception of patients a newly erected two story ward unit which was at present occupied by part of the nursing and domestic staff The report showed that for the first time in the history of the Infirmary there had been an adverse balance amounting to £757 Employees contributions represented 51.5 per cent of the total income of the institution and employers contributions 5.58 per cent The total number of inpatients during 1936 was 2 130 and of out patients 5,836

Auditory Nerve Section

SIR—The possibility of section or partial section of the auditory nerve is a question of great interest to otologists as by this means the most severe cases of Ménière's symptom-complex can undoubtedly be cured

It is very much open to question whether the operating endoscope suggested by Mr Rutherford in his article in the *Journal* of March 27 is likely either to facilitate the operation or to diminish its risks Having spent a great many hours during the past twenty five years in direct laryngoscopy, bronchoscopy, and oesophagoscopy, I have come to realize the limitations of tubal vision and still more the limitation that is imposed on an operative procedure which must be carried out at the end of a rigid tube In the case of exposure of the auditory nerve and in the region of the internal auditory meatus the view through an endoscope might permit the identification of the facial nerve pars intermedia and auditory nerves, as their relationship is constant but the nerves are accompanied by vessels whose relationship is not so constant and it would seem that to limit one's field of vision and manipulation to an endoscopic area without the possibility of any lateral approach might result in the disaster that it is its intention to avoid

The approach to the auditory nerve by open operation under local anaesthesia and after evacuating the basal and lateral cisterns is a matter of comparative simplicity and the operation has passed long beyond the experimental stage MM Ombrédanne and Aubry working in Hautant's clinic in Paris have evolved a technique which they have employed in more than forty cases With their method a free exposure of the region of the internal auditory meatus is obtained the nerve required can be picked up with a crochet hook and divided or partially divided and vessels can be avoided or bleeding dealt with by

electro-coagulation with the assurance that any untoward happening can readily be located

Endoscopy in tubular structures is an unfortunate necessity but to apply it to regions which can be more adequately exposed and dealt with more accurately by a carefully planned approach does not seem to me to be an advance in surgical procedure—I am, etc.,

London W1 April 19

WALTER HOWARTH

Treatment of Leucorrhoea by Zinc Chloride

SIR—When we first considered the treatment of leucorrhoea due to the excessive activity of the cervical glands, whether inflammatory or functional we had foreseen the possibility of stenosis caused by scar contraction after the separation of a slough, as suggested by Dr Worrall. For this reason we began by using the method described in the *Journal* of January 16 (p 116) on cases which were to be operated upon either by amputation of the cervix or by hysterectomy during the following few months in order to study the histological changes that followed separation of the necrotic mucous membrane. We noted the rapid resolution of the inflammatory zone at the line of demarcation and complete re-epithelialization of the denuded canal within two months, and decided that the method might safely be used as a form of treatment.

In a follow up clinic established over two and a half years we kept a close observation on more than 100 patients treated by this method, and examined them periodically with the possibility of cervical stenosis in view. In not one instance was there the slightest development of contracture of the lumen and in a few cases that needed reapplication a larger pencil than the preceding could always be inserted with ease. Histological examination of over twenty cervixes following an experimental application of the pencil fully supported these clinical findings. The possibility of scarring and stenosis is brought to a minimum by the presence of the slough, which very efficiently preserves the contour and size of the cervical canal until it is cast off at the end of the first week, leaving the processes of resolution well established beneath. Cervixes studied microscopically some two months after the separation of the slough show no greater evidence beneath the new epithelium of the previous inflammation than small numbers of lymphocytes (see Figs 6 and 7 of our article) and there is no sign whatever of any fibroblastic reaction such as might subsequently give rise to contracting fibrous tissue.

Repeated applications of zinc chloride a former German treatment mentioned by Dr Worrall in his letter, might well give rise to scarring tissue since any attempt at epithelialization in the canal is constantly being thwarted so that the lining is for several weeks composed of raw granulations which are being continually inflamed and irritated by fresh applications of zinc chloride. After the single treatment with a clay pencil which we described the canal is left lined by granulations for at the most two weeks after the separation of the slough after this time it has become epithelialized and the inflammatory exudate in what was previously granulation tissue can be seen rapidly to resolve leaving finally connective tissue which is indistinguishable from that normally found between the cervical glands. Simple painting of the cervical canal by weaker solutions of zinc chloride are quite useless as a means of destroying the vast number of deeply branching glands. This is clearly evident if a large number of sections of the cervix are carefully examined and it was this failure to destroy the glands and the disappointing results of all chemical treatment which made us feel that nothing short of chemical endocervicectomy would be

of any value. If simple repeated chemical application were successful, surgeons would not have attempted to cure the disease by diathermy, the cutting curette and various operations.

We would like to take this opportunity of answering some of the points raised in the large number of letters we have received personally. The clay applicators may be used repeatedly. After use they should be washed and soaked in water for a few hours dried and then replaced in the saturated solution of zinc chloride ready for further use. To obtain the best results it is important to use the largest applicator that can be pressed into the cervical canal in order to ensure that the folds of the mucous membrane have been flattened and are wholly in close contact with the applicator. It must be pressed well home preferably so that its butt end is just inside the external os. If it is only partially inserted it will almost certainly be squeezed out into the vagina during the following two hours. Unless the patient is tolerant we find that brief anaesthesia such as gas or evipan is almost essential.

Lastly it is necessary to select the cases carefully. If the cervix is deeply torn or the os is so patulous as not to grip the stick firmly there will not be sufficiently close contact between it and the whole of the mucosa. But if a large size applicator is used and inserted for its whole length and tightly gripped by the cervical canal we can promise a satisfactory result.

—We are, etc.,

Obstetrical Flying Squads

SIR—With reference to the note in the *Journal* of April 3 (p 728) regarding the attack on maternal mortality by the Birmingham Maternity Hospital I would like to report that such a service has operated from the Lanarkshire County Council under my supervision since December, 1931. During that time approximately 300 cases have been attended by our flying squad, with very gratifying results, which have already been communicated to another authority for publication. This report will appear at an early date—I am, etc.

H J THOMSON

Medicinal Kaolin in Food Poisoning

SIR—In the *Journal* of April 17 (p 835) Mr Norman Evers draws attention to the standardization and peptization of medicinal kaolin. Peptization or dispersion is affected by many ions. These are supplied not only by the electrolytes of foodstuffs alimentary secretions and prescription but also by the electrolytes already present in kaolin as it leaves the mine. Such electrolytes are present in all kaolins which have been won or cleansed by water no matter whether the purification has been by simple elutriation with moorland water or by the more elaborate catalpo or osmosis processes. They usually promote flocculation or coagulation rather than dispersion.

The biochemical problems involved when solid adsorbents are taken internally are indeed complex. They offer a wide field of interesting and important research for a team of workers with special knowledge of physical and organic chemistry as well as bacteriology, pharmacology, and clinical medicine.

In the application of adsorption therapy to the treatment of food poisoning it is rational to let the practising physician know as precisely as possible (1) the range of poisons of clinical interest for which the adsorbent has special affinities (2) the amount of each poison which can be removed by a given weight of material. Antitoxins

are assayed in terms of toxin. On the grounds of practical utility it is desirable that antidotes such as kaolin should be assayed in a comparable manner.—I am, etc.,

Angina Innocens

SIR—Dr Trevor Davies's letter in the *Journal* of April 17 indicates the real difficulty which exists in diagnosis of some cases of cardiac pain. This is largely due to two points. First, extensive coronary disease may exist with no evidence of cardiac enlargement or disease as shown by electrocardiograph and by x-ray or clinical examination. In one such case I found that both coronary vessels would scarcely admit a bristle. The second point is that in patients with cardiac pain as in so many other diseases, there is not infrequently a mixture of both functional and organic symptoms. Hurst has discussed this fully, and Paul White, in his book on heart disease, notes it in connexion with cardiac pain. In my experience it is not uncommon to find that the clinical picture of angina innocens may be added to that of angina of effort, or spasmodic angina, in some cases. It is generally possible to define the different types, although in a few cases it is exceedingly difficult.

The best point to stress in disentangling the two appears to be to define with exactitude whether the pain comes on during exertion, and, if so, to persist in the cross-examination of the patient until it is clear whether that pain is definitely quantitative to exertion. Pain which comes on during exertion disappears with rest and is quantitatively related to exertion indicates in my experience the presence of a definite, though possibly slight, coronary lesion. If such a pain is present whatever other types of pain may also be found angina of effort is present. It is essential for the ultimate clearing up of the difficult points in this problem that every effort be made that such cases as that described by Dr Tudor Davies be most carefully investigated as regards their symptomatology, and that a detailed post-mortem examination be made in the event of death.—I am, etc.,

London W1 April 19

GEOFFREY BOURNE

Diphtheria Immunization with A.P.T.

SIR—I was interested in Dr Chesney's article in the *Journal* of April 17 (p. 807) and would like to confirm the good results he has obtained with alum precipitated toxoid by the two shot method. At this hospital during 1936 a total of 207 children between the ages of 1 to 5 years were given A.P.T. in doses of 0.1 c.c. and 0.5 c.c. with an interval of a fortnight between each injection. Schick-testing after three months yielded the following results: Schick negative 156, Schick positive 3, not tested 48. That is, approximately 98 per cent of those tested became Schick-negative. Although this is not quite such a good figure as Dr Chesney obtained it demonstrates the high efficiency of A.P.T. given in two small doses. Economically it is one of the cheapest methods and limitation of its use to younger children avoids all local and general reactions. Apart from the usual small "nodule" after the second injection there were no reactions in this series of 207 cases.

While I should not quite like to dispense with the subsequent Schick test, as Dr Chesney suggests, the high figure of conversion to the Schick negative state relieves much of the anxiety concerning those cases which fail to return for the test.—I am, etc.,

Blood Sugar Worship

SIR—Dr Oliver Walker's question in the *Journal* of April 17 (p. 835)—asking upon what grounds I base the statement that hyperglycaemia without ketosis or glycosuria is more likely to lead to complications than a normal concentration of sugar in the blood of a diabetic—is eminently fair, and I thank him for not demanding evidence or proof.

F. M. Allen showed before 1914 that hyperglycaemia in a dog which had had five sixths of its pancreas removed led to degeneration of the remnant and rapid death, whereas if hyperglycaemia were avoided the dog might live indefinitely. When the treatment suggested by Allen was adopted and the diet regulated to avoid glycosuria it was found that it was easy to render the patient sugar free but extremely difficult to keep him so. Later when the diet was arranged to prevent hyperglycaemia not only was the disease arrested but a few patients increased their tolerance for carbohydrate.

When insulin became available some of my patients were given only sufficient to maintain them free from glycosuria; these not only required more and more insulin as time passed but also occasionally developed neuritis, retinitis, etc. The patients who received sufficient insulin to prevent hyperglycaemia escaped neuritis and most other complications, but a very small number developed retinitis. Occasionally a patient will recover from neuritis when increased doses of insulin prevent hyperglycaemia. These observations led me to believe that complications were rarer in patients who were not allowed to be hyperglycaemic.

I admit, however, that some individuals appear to be immune to hyperglycaemia. I have seen four untreated patients with symptomless hyperglycaemia and glycosuria enjoy excellent health for close upon ten years. These I have considered to be exceptions.—I am, etc.,

London W1, April 17

OTTO LEYTON

Compulsory Pasteurization of Milk

SIR—I am grateful to Dr G. Arbour Stephens and Mr Paul Bernard Roth (*Journal* April 10 p. 785) for raising two most important issues in connexion with the pasteurization of milk.

No one could disagree with Dr Stephens that the ideal must always be to have healthy cattle and pasteurization should be looked upon as a temporary measure. The eradication of disease among cows must necessarily be a lengthy process and during the intervening period there is clearly need for protection. It should be noted that the medical officer of health has little jurisdiction over the cow herself.

Mr Roth asks whether pasteurization is necessary in the preparation of cream, butter and cheese. Cream probably contains relatively more pathogenic organisms than milk, since bacteria tend to rise to the surface. It is, in fact, evident that cream is more dangerous than milk and that it should be marketed only after pasteurization. Efficient pasteurization by the "holder" process together with rapid cooling gives satisfactory results and the cream is not materially altered by this process (Harvey W. C. and Hill H. 1936 *Milk—Production and Control*). Butter and cheese have been shown by a number of workers to contain tubercle bacilli and *Brucella abortus* (Pullinger E. J. *Lancet* 1935 i 1342). Eight of a series of a hundred outbreaks of food poisoning between 1914 and 1923 (Medical Research Council 1925 Special Reports Series, No. 92) and a recent serious out-

break of Sonne dysentery (Leuchs J., and Heim, E., 1930, *Z. Medizinalbeamte*, 19, 587) were shown to be due to cheese. Pathogenic organisms tend to die out as a result of fermentation but nevertheless it is clearly desirable that butter and cheese should be prepared from pasteurized milk. There is evidence that this is practicable and that it is being done quite extensively. Professor Orla-Jensen in *Danish Bacteriology* 1931 writes: "The pasteurization of cream and subsequent use of good cultures have more than anything else contributed towards making Danish butter a uniform and well-keeping product—I am etc.,"

Medical Officer of Health

Blood Films in Lead Poisoning

SIR—The greatly extended use of lead in the metal rubber electrical, and other industries suggests that lead intoxication must be commoner than ever before. This is confirmed by the final report of the Committee on Ethyl Petrol (H.M. Stationery Office 1930), which proves that normal urine contains lead and that the lead hazard is omnipresent. Thus early diagnosis cannot rest on laboratory reports of a trace of lead in the urine but must depend on symptoms even less marked than formerly, and on signs amongst which the blue line on the gums has almost vanished, and blood changes alone remain important.

Blue Line—Since the war workers have had dental treatment and clean their teeth more regularly so that the typical blue line is seldom seen and must be looked for with a lens in a good light. Its presence indicates lead absorption but if excretion is adequate the worker remains healthy. In plumbism of domestic origin the blue line is often absent and in mild cases diagnosis used to be so uncertain that I was much interested in the earlier reports on the blood film and by 1907 was convinced that evidence of lead absorption obtained in this way made us independent of the blue line in diagnosis.

Blood Film—The blood film is examined for evidence of pathological regeneration. In pernicious anaemia the marrow is greatly altered and punctate basophilia and other changes in erythrocytes are so constantly present in the blood film that they are accepted as evidence of pathological regeneration. Now in any serious anaemia with failing normal regeneration we expect the onset of the pathological process to meet the emergency but in early plumbism there is no anaemia yet pathological regeneration—which is not needed—precedes all other symptoms and must be regarded as evidence of reaction of marrow inevitably excited by small doses of lead. In man the changes are both nuclear and cytoplasmic and as long as the marrow is capable of normal regeneration there will be pathological regeneration too if there is lead in the blood.

In the course of normal regeneration every corpuscle enters the circulation more or less polychrome and for the first few hours is a reticulocyte but within twenty-four hours it becomes mature and loses its polychromasia. If the demand is urgent polychrome erythroblasts also appear but become normoblasts in twenty-four hours.

Pathological regeneration is well seen after giving lead acetate 1 grain three daily for ten days. Polychromes and therefore reticulocytes are increased, many are larger and some show basophil punctation which as I have shown persists for twenty-four hours after polychromasia has disappeared (*Lancet* 1920 1 1110). Nuclear changes appear at the same time as these cytoplasmic changes often in the same corpuscle. Some polychromes show azur (Cabot) rings or arcs which also survive polychromasia, and are evidence of pathological regeneration. Commonly punctation is seen in 1 in 1000 corpuscles and perhaps in twice this number rings are usually less numerous. Punctation has been adopted as an

index of pathological regeneration just as reticulation has in total regeneration and occasionally both are seen in the same corpuscle. Routine methods stain the punctate changes poorly and the rings not at all thus sacrificing half the available evidence. But both stain well with polychrome Manson's methylene blue and eosin (*Journal* 1930 2 213).

I speak of the blood film with confidence because I used it to control the administration of lead in anaemia and in haemorrhage and since 1915 in cancer. When it is given as suggested rings and punctations appear by the fifth day, and erythroblasts, which are often punctate, before the tenth. I tested the blood films of painters and packers, and in plumbism from beer, from abortifacients and from unknown sources. Rings and punctations should not be found in painters, and their presence indicates faulty working conditions. Plumbism means culpable carelessness, often of a foreman, and the victim has blood changes up to punctated erythroblasts.

A beer had an average of one grain of lead to the gallon for fifty-five days and a woman who drank one pint daily had colic and her blood showed rings and punctations. Her illness was mild but several men who drank a quart or more daily had typical plumbism with punctated erythroblasts. Again a woman was admitted to hospital as having alcoholic neuritis. Careful inquiry proved that she was really abstemious and other possible causes of her neuritis including lead were considered without definite result. At this stage (July 1908) examination with Leishman's stain showed a normal blood film except for a little punctate basophilia. Had she been seriously anaemic one might have supposed that pathological was assisting failing normal regeneration but in approximately normal blood basophilia is an utter discord and presumptive evidence of lead absorption. The source of lead was not discovered but subsequent progress supported this diagnosis.

Healthy workers in accumulator factories may excrete 0.35 mg of lead per litre of urine which we may reckon at two litres daily (Final Report on Ethyl Petrol p. 90). Now the bowel excretes more than twice as much as the kidneys so that a total daily excretion of 2 mg of lead is preventing accumulation. Experimentally by subcutaneous injection in cats it has been found that lead taken up by the bones equals more than half the total excretion (Aub. Fairhall Milnot and Reznikoff 1926 *Lead Poisoning* p. 82 and Table XVII). The worker therefore is storing in his skeleton at least 1 mg. of lead daily and must be absorbing about 4 mg. (1/16 grain) daily. Now the woman taking 1/8 grain (8 mg.) of lead daily in her beer had plumbism in fifty-six days. The danger point, therefore, lies between 4 and 8 mg of lead daily.

Many live just outside the danger zone. Though symptoms are absent no one suggests that the marrow is better for long-continued irritation and meanwhile other important tissues may be damaged. Dr David R. Lewis has proved the association of peptic ulcer with long exposure to lead absorption (*British Medical Journal* 1932 1, 185) and since then I have found pathological regeneration still present in films from a painter on discharge from hospital after treatment of gastric ulcer. In any workman exposed to lead the presence in the film of erythroblasts particularly if punctated indicates that suspension from work is necessary. Punctate basophilia and Cabot rings are never present in healthy blood—I am etc.

ROBERT CRAIK, M.D.

Dermatitis Artefacta

SIR—The interesting paper by Dr E. W. Prosser Thomas in the *Journal* of April 17 (p. 804) recalls to my memory a case of dermatitis artefacta which I saw more than a quarter of a century ago.

The patient a woman of a neuropathic type in the early forties had always enjoyed rather indifferent health and had had two abdominal operations. There appeared on her

right upper arm (she was left-handed) blisters with considerable surrounding inflammation. I suspected that these were self-inflicted and a surgical colleague who kindly saw the case with me arrived independently at the same diagnosis. He promptly put the arm up in plaster and the blisters cleared up in due course without any local treatment other than a single dressing, there was no recurrence. It was found that in producing the lesions she used matches.

—I am, etc.,

London, W 1 April 17

EVA MCCALL.

Intraperitoneal Haemorrhage from a Graafian Follicle

SIR—A further case of intraperitoneal haemorrhage from a ruptured Graafian follicle may be of interest.

A girl of 20, single, was waiting for an interval appendicectomy having had at least six more or less acute attacks of appendicitis of the "obstructive" type spread over some six to nine months. She was seen originally just as a typical attack was subsiding, and was due for operation in a week or two. These attacks bore no relation to the periods and there had never been any dysmenorrhoea. She was seen at 7 p.m. on March 20 following an attack of acute pain, which she described as exactly similar to the previous appendicular pain. On close questioning, since she was exactly half way between two periods and the recent correspondence was fresh in mind she said that for the last three months she had suffered slight pain radiating to the epigastrium—in contradistinction to her "appendicular" attacks (see letter from J. C. Leedham-Green *Journal* March 6 p. 527) apparently just half way between the periods.

Immediate operation was performed since her temperature was 99.8° F, her pulse rate 110 and there was rigidity of the right rectus with marked tenderness over McBurney's point, hyperaesthesia etc. A right paramedian subumbilical incision showed no free fluid but a long retrocaecal appendix was firmly bound down by a broad adhesion half way between caecum and tip—with a Jacksonian membrane and much congestion. The appendix was removed with some difficulty. On exploration the right ovary was found to be the size of a pigeon's egg and cystic and a thin but steady trickle of blood was coming from a small cyst. After trimming up the cyst some difficulty was experienced in suturing the wound firmly enough to stop the haemorrhage since the sutures cut out repeatedly (see the case reported by J. C. Nicholson *Journal* March 13 p. 585). I was unwilling to remove the ovary forthwith in a young patient, since there was quite a lot of normal ovarian tissue present. Later however I regretted this decision since her pulse rate rose slowly for several days to 116 after coming down to 80 although her temperature subsided. There was, too, some pain in the iliac fossa possibly due to sutures in the ovary which are always said to be painful.

Injections of calcium gluconate morphine etc. did not help and since the pulse volume was good and one naturally did not want to reopen the abdomen unless it was absolutely essential further measures were tried. These consisted of an intravenous injection at a rate of not more than 2 c.c.m. a minute of 10 c.c.m. of sodium and magnesium citrate (Dr. Todd's Bristol Royal Infirmary haemostatic solution—B.D.H.). Within a few hours the pulse rate had begun to fall reaching 80 within twenty-four hours and further convalescence was uneventful.

I have reported this case in some detail since the two conditions obstructive appendicitis and intraperitoneal haemorrhage from a ruptured Graafian follicle were present there was no history of dysmenorrhoea there was no question of pregnancy sutures failed to control the haemorrhage following the post-operative rise of blood pressure and intravenous injection of a solution of sodium and magnesium citrate apparently did control the haemorrhage. Incidentally I have used this solution many times as no doubt dozens of other former house surgeons of the

Bristol Royal Infirmary have done, with no alarms and almost invariable control of any reasonable haemorrhage. It seems insufficiently well known.

Most of these cases appear to be of haemorrhage from a Graafian follicle, but the second case reported by J. C. Leedham-Green seems to be one of haemorrhage from a luteal cyst, since it occurred two days before a period was expected (not mid-menstrually), and the cyst was lined with luteal cells.—I am, etc.,

CRESSWELL DAVIS M.B., M.R.C.S.

Highbidge Somerset, April 5

The Birching of Children

SIR—In the *Journal* of April 10 (p. 785) Dr. Bentlif advocates corporal punishment 'carried out humanely'. From what was said in your excellent leading article on judicial birching it is hard to conceive how such a procedure can be humanely carried out—it certainly puts a wide interpretation on the term 'humane'.

Dr. Bentlif draws an analogy with corporal punishment at public schools. Apart from the fact that this may be deleterious there is an important difference. Parents who dislike the system can withdraw their children. The working-class parent when judicial birching is ordered, has no option—except perhaps in cases such as those cited when the alternative of imprisonment is offered.

The letter concludes with the usual diatribe against psycho-analysis, and Dr. Bentlif makes the dogmatic assertion that it can do incalculable harm and turn healthy young people into neurotics. It would be interesting to know on what grounds he makes this statement. During the last few years I have seen a considerable number of cases of neurosis and psychosis at various out-patient clinics and in wards children both normal and "problems"—the latter at a child guidance clinic. It is rare to come across patients who have had previous psychotherapy: the patients I have seen in five years who have been psycho-analysed could be counted on one hand (and this includes private patients who have had more facilities). Where then has Dr. Bentlif come across the material which allows him to make this sweeping observation? (I am no psycho-analyst but I know from collecting results of psychotherapy how extraordinarily difficult it is to arrive at conclusions on the efficacy of treatment.) One is tempted to wonder whether it is not bias rather than scientific observation which actuates his assertion. In which case how much importance can one attach to his observation that the victim 'left the prison as if nothing had happened'? And if so what good was the birching? But surely the fundamental psychological error lies in the idea that the boy accepts the punishment as part of the game—that is the essence of sportsmanship. If things have come to the pitch that nothing short of imprisonment or birching is going to act as a deterrent then it appears highly unlikely that the delinquent would adopt such a very 'old school' attitude ' (or is he a Colonel Blimp in embryo?)'. What Dr. Bentlif leaves out of his calculations is that a boy who is already an enemy to society is not going to react in this spirit but as you yourself pointed out in your leader is frequently going to become more resentful and more anti-social than before.

In conclusion it is worth remarking that probably the greatest of all children's magistrates Sir William Clark Hall discontinued ordering birching completely, on the grounds that it was no use.—I am, etc.,

W. LINDSAY NEUSTATTER M.B., M.R.C.P.

London W 1 April 10

Combined Universities Election

SIR—The implication, stated or implied in the letters of Dr J S Manson (*Journal* April 3 p 729) and Dr Walter Asten (April 10, p 786) that the result in the Combined Universities Election was a deplorable party triumph over an independent candidature does not bear examination. First the successful candidate was supported by nearly all those members of all parties and of no party who assisted Miss Eleanor Rathbone in what was the first completely independent candidature in this constituency. Secondly, the reasoned argument in Sir Henry's election address on complete independence which according to Dr Manson has carried so little weight with that portion of the constituency which included medical graduates may have been rejected by some because they feel that even a candidature based on a resolution of the Representative Body of the British Medical Association may not conform to their ideas of independence. It is to be noted that the general electorate were not informed of the origin of the candidature.

It is possible for many to honour and respect Sir Henry Brackenbury as they do and still to feel it right to support another candidature. It is churlish to reflect on the success of the successful independent candidate by ascribing it to a blind party loyalty, to which it obviously was not due—I am etc.,

School of Medicine Leeds April 12 FRANK C HAPFOLD

Radiograph or Skiagram?

SIR—Mr Lawson and Dr Myles may prefer skiagram and radiograph respectively but there is only one word which truly meets the case—namely, rontgenogram—about the meaning of which there can be no doubt. This and the other members of the same group rontgen bild rontgenaufnahme etc., are almost exclusively used in the American Scandinavian and German medical literature. For general clinical use the shortest word will always be most popular, and the x ray, short for 'the x-ray photograph', will be hard to supplant—I am, etc.,

A G G MELVILLE FRCS ED

Victoria Infirmary Glasgow

Reprints of Papers

SIR—From time to time I receive reprints of papers which have appeared in various periodicals. May I call attention to a not uncommon fault in these reprints? It is the omission of the number of the first page of the article. I have before me a reprint from a well known scientific publication. It gives the name of the journal, the number of the volume, the number of the issue and the date of publication, but no page number. In a country like this it is not always possible to get into touch with a library to repair the omission and I find the impossibility of inserting a page number a difficulty in carrying out properly the Harvard system of references—I am etc.

Nairobi Kenya March 27

JAMES H SEQUEIRA

The Institute of Linguists (Lambert House 10 Ludgate Hill E C 4) of which Sir Francis Goodenough is president has reissued in an enlarged form its approved *List of Translators and Interpreters*. An index of trades and an index of languages are included, also the scale of minimum charges for translations confirmed at a conference of translators and interpreters held in London in 1935. This classified list is intended mainly for commercial and business houses but a few of the translators claim acquaintance with medical terms.

Universities and Colleges

UNIVERSITY OF LONDON

The regulations for the Academic Post Graduate Diploma in Medical Radiology were amended at a meeting of the Senate on March 17 by the deletion of the following words in the seventh paragraph on page 617 of the *Red Book* 1936-7.

A mark of distinction will be placed against the names of those candidates who show exceptional merit in the whole examination whether taken at the same time or in two parts.

Sir Ernest Graham Little was appointed representative of the University at the celebrations to be held on the occasion of the four hundredth anniversary of the foundation of the University of Lausanne from June 3 to 5.

The ceremony for presentation for degrees will take place at the Royal Albert Hall on Thursday May 20 at 2.30 p.m. and at 5.30 p.m. the same day the annual service for members of the University will be held at St Paul's Cathedral. The preacher will be the Right Rev Frank Partridge DD Bishop of Portsmouth. Applications for tickets accompanied by a stamped addressed envelope should be sent to the honorary secretaries Presentation Day Service Committee 42 Tooting Square W C 1.

UNIVERSITY COLLEGE

A course of three lectures on 'The Meninges and the Cerebro spinal Fluid' will be given by Professor Lewis H Weed, director of the School of Medicine and professor of anatomy in Johns Hopkins University Baltimore at University College Gower Street, W C on May 24, 26 and 28 at 5.30 p.m. At the first lecture the chair will be taken by Professor H H Woollard.

A course of four lectures on 'The History of Physiology' will be given in the Department of Physiology Pharmacology and Biochemistry at University College Gower Street W C, as follows: May 18 'Ancient Biological Conceptions' by Dr E S Russell, May 20 and 21 'Emergence of Modern Doctrines to the end of the Eighteenth Century' with special reference to the growth of views on the circulation of the blood by Professor Charles Singer, May 24 'Development of Theories regarding Combustion and Respiration in the Eighteenth Century' by Dr D McKie, and May 25 'The Development of Certain Aspects of Metabolism during the Nineteenth Century' by Dr F G Young. All the lectures are at 5.30 p.m. and are open without fee or ticket to students of the University and others interested in the subject.

A course of three lectures on 'Some Economizing Mechanisms as a Condition of the Body's Adaptation to Increased Activity' will be given at University College Gower Street W C by Professor H Rein, director of the Physiological Institute in the University of Göttingen on May 3, 4 and 6 at 5 p.m. At the first lecture the chair will be taken by Professor C A Lovatt Evans FRS. The lectures which will be delivered in English and illustrated by films and lantern slides, are addressed to students of the University and to others interested in the subject. Admission is free without ticket.

LONDON SCHOOL OF HYGIENE AND TROPICAL MEDICINE

WESTMINSTER HOSPITAL MEDICAL SCHOOL

At the recent Entrance Scholarship Examination in Anatomy and Physiology scholarships were awarded to F C N Holden (King's College London) and P D Trevor Roper (Clare College Cambridge).

COLLEGE OF PHYSICIANS AND SURGEONS OF BOMBAY

The Council of the College of Physicians and Surgeons of Bombay at its meeting in January decided to institute an examination for the Diploma in Ophthalmic Medicine and Surgery. A committee appointed to draw up regulations and a syllabus of study for the diploma reported to the Council at its meeting on March 12, when the report was adopted. The first examination for the diploma will be held in July. A copy of the regulations can be obtained from the secretary of the College.

Obituary

ARCHIBALD DONALD
LLD MD FRCP FCOG

Emeritus Professor of Obstetrics and Gynaecology Manchester
University Consulting Gynaecological Surgeon Manchester
Royal Infirmary Consulting Surgeon, St Mary's
Hospital Manchester

We regret to announce the death at his home in Alderley Edge of Dr Archibald Donald on April 17. He had been in failing health for some time, and had not the strength to recover from an attack of influenza.

Archibald Donald was born in Edinburgh in May, 1860, and was educated at Craigmount House School and Edinburgh University. Before proceeding to the medical course he took his M.A. in 1880 including in this philosophy and logic and this training stood him in good stead in later years. He graduated M.B. Ch.M. with honours in 1883 and proceeded to the M.D. in 1886. After having held resident posts at the Royal Maternity and Simpson Memorial Hospital in Edinburgh he was appointed house surgeon and resident obstetrical surgeon to St Mary's Hospital then in Quay Street, Manchester in 1885 and so began his long connexion with that city and hospital which was to end only with his death. This was one of the most important resident obstetrical and gynaecological posts

in the kingdom as the hospital attended about 4,000 maternity cases annually for all of whom the senior resident was responsible as well as having forty gynaecological beds for which he acted as house surgeon. He held this post for three years and then started to practise as a consultant in this branch of medicine with a clinical experience which very few men of his age had obtained. In 1888 within a few months of leaving the hospital Dr Cullingworth was appointed to the staff of St Thomas's, London and Donald was elected to the vacancy on the staff of St Mary's Hospital.

In those days operative work was conducted in a theatre which was a bare room with no means of artificial

illumination, washing arrangements were inadequate, there were no steam sterilizers, only a large pan in which the instruments were boiled, there was no central heating, only a small open fire, no modern table which could be moved into Trendelenburg's position, only a flat-topped wooden table. In these inadequate surroundings pioneer surgery was done, but it could be carried out only by men endowed with more than average strength of character and mental equipment. At that period the scope of abdominal surgery was expanding rapidly, following the pioneer work of Clay, Spencer Wells and Lawson Tait, and Donald a young recruit to gynaecology naturally wished to follow in their footsteps.

Seniors however do not always take kindly to the experiments of a younger colleague and in later years Donald often laughed over the methods employed by his seniors in limiting his opportunities. As an equal member of the staff he claimed an equal use of the theatre but they insisted upon their prior claim of seniority so whenever he had carefully prepared a patient for an abdominal section they preceded him with a filthy septic case which precluded any clean operation for the remainder of that day. It was not long before he had this rectified but in the interval he turned his mind to the cure of prolapsus uteri. Since Manchester was a centre employing much female labour cases of complete procidentia abounded, and up to now these were definitely incurable. The only attempt at palliation was to tighten the perineum so that the

vagina would hold a pessary. Donald decided to try to cure this condition and the more he was told how useless was the attempt the more determined did he become. In 1888 he operated upon five of these cases combining an anterior and posterior colporrhaphy and perineorrhaphy with amputation of the cervix. Silver wire was the suture material in the first two cases and both were cured, being able to follow their occupation as charwomen without any return of their trouble. In this same year he heard that some German surgeons were using catgut as suture material so he obtained a supply and used it in his third case which he did in two stages. So successful was this case that he never again used any other material except

four silkworm sutures for the perineum in his colporrhaphies. This catgut was sent over in small bottles of carbolic oil a large number of which I found in an old cupboard in the hospital twenty years later. So impressed was Donald with this material that he experimented with other methods of sterilizing catgut, which he used more and more for all types of operation, till finally he discarded all other suture materials. He must have been one of the first surgeons in this country to use it certainly as a standard suture and in the whole of his long career he had only one case of tetanus. Donald was a brilliant operator and his small hand allowed him to use an incision which in those days of small incisions, was the envy of his contemporaries and he was able to turn to practical use many suggestions which otherwise would have been failures.

Donald was notable too for a clear and logical outlook which allowed him to distinguish, among the many new suggestions of those days procedures which had a practical value while ruthlessly rejecting those which were merely novel. His inquiring mind was never content to accept a statement merely because it had the impress of age and one of the strong lines he took at an early age was against the then accepted idea that retroflexion was the common cause of female ills. Being an easily recognized condition and in many cases one which was easily rectified, it became fashionable to replace these retroflexed uteri and insert a pessary, and in Donald's time some abdominal reposition operation was often employed. Nowadays it is difficult for a young gynaecologist to realize how firmly held were the views with regard to this condition and what temerity was required for a young man to assail them.

He was a strong believer in the curette, but he advocated its use in special cases and not indiscriminately, and when he used it he scraped the uterus clean. He read many papers before the London Obstetrical Society and the North of England Obstetrical and Gynaecological Society. I remember with gratitude how Donald took me to read my first paper before the London Obstetrical Society in 1906 just as Cullingworth had taken Donald himself twenty years earlier. In the flood-tide of his career Donald had little time for writing: he was much too busy attending to his innumerable patients, both in hospital and in private practice and he trusted to direct teaching to publish his views. This is unfortunate, as much of his work is unrecorded and part is absorbed in that of others who watched and learned from him. His early days were the golden era of gynaecology and fortunate was Manchester to have at that time a man endowed with such originality, logic and operative ability. In 1895 on the retirement of Lloyd Roberts he was appointed honorary gynaecological physician to the Manchester Royal Infirmary, having become a member of the Royal College of Physicians a qualification then essential for the post a short time earlier. Although Donald was naturally attracted to the rapidly developing field of gynaecology, he was always deeply interested in obstetrics and many of his early papers are on obstetrical subjects. He served on the Departmental Committee of the Ministry of Health which reported upon the cause and prevention of puerperal sepsis and this was the last subject I discussed with him. He held the view that there would be little puerperal sepsis if the attendants used a plentiful supply of an efficient antiseptic for their hands.

In his early days he wrote *An Introduction to Midwifery* for students and nurses which ran through many editions and was for many years a standard textbook for mid-

wives. He was the acknowledged leader in his branch of medicine in Manchester and the thickly populated area around it and the wonder was that he was able to get through such a vast amount of work. Slight of build and frail in looks, it often seemed impossible that he could carry on, but one of the secrets of his success was his refusal to be fussed. If he was late he serenely carried on and allowed his mind to relax when he had finished. No matter how difficult the position Donald always had full control of himself and in over thirty years of the most intimate co-operation I never once heard him use even the mildest of expletives. The only sign that things were critical was the use of the title doctor instead of the more familiar surname and on these occasions every one worked under tension until the corner was turned. In 1912 on the death of Sir William Snelair, he was appointed professor of obstetrics and gynaecology of the Victoria University of Manchester but systematic lectures on rigid lines never appealed to him, and in 1920 he persuaded the University to bring obstetrics and gynaecology into line with general medicine and surgery and create a chair of clinical obstetrics and gynaecology. This he enjoyed, as he chose his own subjects and demonstrated cases in his inimitable way calling upon the vast storehouse of his clinical memory. This was another of Donald's outstanding features. He rarely forgot the details of a case, and when confronted by a puzzling set of symptoms he could usually recall a case with similar features and so make a correct diagnosis: this gift at times seemed almost uncanny. It was in 1925 that he resigned his chair and was elected emeritus professor.

During the war he was attached to the Second General Western Hospital as a surgeon and threw himself heart and soul into the work, and for his services he was made a Deputy Lieutenant of Lancashire. Donald was one of the most modest of men. He never raised a finger to obtain recognition and scorned those who did. Not infrequently he stepped aside and allowed another to occupy an office that should rightly have been his. Nevertheless, when honours came entirely unsought especially from his professional brethren they gave him great pleasure. He was a past president of the Obstetrical Section of the Royal Society of Medicine, past president of the North of England Obstetrical and Gynaecological Society of which he was one of the founders, past president of the Manchester Medical Society, and a past president of the Manchester Pathological Society. His old University of Edinburgh conferred upon him an honorary LL.D. in 1927 when the British Medical Association met in Edinburgh to celebrate the centenary of Lord Lister. The University orator, in presenting him for the conferment said: "When gynaecology was undergoing its most rapid expansion he was in the vanguard of the movement. A bold and skilful operator, original in his ideas and quick to recognize and adopt any new and sound suggestion, he has done more than any one man to raise the Manchester school of gynaecology to its present eminence. Edinburgh is proud to recognize the sterling value of the work which this *alumnus* of hers has done." The Edinburgh Obstetrical Society made him an honorary Fellow and the Liverpool Medical Institute made him an honorary member along with Lord Dawson of Penn and Sir Robert Jones as representatives of the three branches of Medicine.

Donald had a lovable nature. A strong character with perfect control over himself, he nevertheless made allowances for others especially younger men not so well endowed as himself. Generous to a fault, genial, easy,

in manner and loving his fellow men he was at his best when acting as host especially to younger men or away on a golfing holiday with old friends. Those who worked under him revered him as a chief and loved him as a man and when he retired from the active staff of St. Mary's old residents attended from far and near a dinner in his honour and presented him with his portrait of which each cherished a reproduction. Happy and successful in his work happy in his home life he like all others had his draught of bitterness. His eldest son a youth full of promise was an Oxford undergraduate when war broke out and joining up at once laid down his life in Gallipoli. His third son after being called to the Bar also died after a long illness. He leaves a widow two sons and two daughters one son in the Navy and the other a member of his own profession already well established as one of the younger consulting physicians in Manchester.

W F S

Professor Daniel Douglas writes

In obstetrics and gynaecology as in politics there is a Manchester school of thought, and its founder was Archibald Donald, whose death we mourn to day. His influence began to make itself felt soon after his arrival from Edinburgh in 1885 and continued with unabated force until his retirement from active hospital practice forty years later. Donald was a clinician first and last and Nature endowed him with all the mental and physical qualities which make for success in that field. Not the least of these and one which he retained to the end of his working days was an extraordinary capacity for assimilating new ideas and applying them in the treatment of his patients. Despite the claims of an enormous hospital and private practice Donald found time to make important contributions to the literature of obstetrics and gynaecology. His pioneer work on the treatment of genital prolapse is well known and will no doubt be referred to elsewhere but almost as far reaching was his advocacy of a more rational treatment of uncomplicated backward displacements of the uterus. It is largely due to Donald's teaching that the indiscriminate fixing up of the retro flexed uterus has now been abandoned.

He retained a youthful outlook almost to the end and was never happier than when in the company of his younger colleagues. Until a few years ago he rarely missed a meeting of the North of England Obstetrical and Gynaecological Society and those of us who were privileged to be his companions on the train journeys between the different meeting places in Lancashire and Yorkshire will always be grateful for his cheery companionship and inexhaustible fund of anecdote. At the meetings of our Charles White Club he was also in his element and his colleagues are not likely to forget the summer meetings at Alderley when Donald always the perfect host entertained us to a dinner of such excellence that the indifferent golf which preceded it was mercifully forgotten. Now he has died full of years and secure in the memory and affection of his friends who can say with truth as he passes on—there goes a man!

A Surgeon Colleague writes

To those who recall the extraordinary activities physical and mental alike of Archie Donald throughout a long and extremely distinguished professional career it must have caused distress to witness the rapid decline of the last few months during which he was confined indoors quite unable to enjoy the beautiful garden which he loved so well and on which he had expended so much time and

interest and energy. Of the details of Donald's career other colleagues in his special sphere of work are in a much better position to testify than I but it is of Donald the man himself that I would pen a few words in most affectionate memory. Widely recognized from his early days as the outstanding exponent of his chosen specialty Donald was throughout completely free from any hint of professional jealousy and his help was always most willingly and cheerfully given to his younger colleagues. Indeed most members of the honorary staffs of the Manchester Royal Infirmary and the St. Mary's Hospitals owe their position largely to his support since his influence with the governing bodies was greater than that of any other individual medical man and to have Donald on one's side practically connoted success in such elections. His modesty so far as it concerned his own most valuable and original work was carried almost to the point of absurdity, for although he was undoubtedly the originator of the Manchester operation for uterine prolapse this procedure has elsewhere come to be associated with the name of one of his younger colleagues who first learned it from his senior and whose only contribution thereto was a trifling and comparatively unimportant modification. Endowed with an almost uncanny power of sifting the wheat from the chaff among the many suggestions in the medical journals of his day he was ever quick to seize upon and to put into practice those he considered to merit for real progress. A powerful and fearless advocate of what he believed to be right he was absolutely intolerant of shams and frills of every description and although his advice when sought did not always coincide with the seeker's own inclinations yet in the long run it invariably proved correct. No one could be more loyal or generous as a friend and the many happy hours spent with him on the golf links and at the billiard table though almost without exception to my own gross undoing remain as priceless recollections.

The loss of his eldest son killed on the Gallipoli Peninsula was a cruel stroke of fate from which he never really recovered. At the outbreak of the great war Donald then aged 54 joined the *à la suite* staff of the Second General Western Hospital with the rank of captain becoming thereby junior to most of those considerably junior to himself in civil practice for some months in addition to his other military duties he took his turn to live in and do what was in reality merely the work of a house surgeon—an admirable instance of his loyalty and devotion to what he thought to be his duty. So passes into the realm of our most treasured memories one whom all who had the honour of his close acquaintance proudly regard as a conspicuously brilliant example indeed the very embodiment of what is after all the very finest of all the many fine species that go to constitute the genus *homo* in every sense of the word and in every aspect and action of daily life the truly British gentleman.

later became surgical specialist to a base hospital in Mesopotamia and to the 1st Scottish Casualty Clearing Station. He was also medical officer to the Scottish Horse and reached the rank of lieutenant colonel R.A.M.C.(T.A.). After the war he decided to devote himself to orthopaedics. He was appointed lecturer in regional anatomy at University College, Dundee and clinical surgical tutor and assistant to the professor of pathology at St Andrews University, becoming later honorary assistant surgeon and anaesthetist to the Royal Infirmary of Dundee. He joined the British Medical Association in 1917 and was a Fellow of the Association of Surgeons and an associate member of the Orthopaedic Society of Great Britain.

Mr Taylor made various communications to current medical literature including *Three Cases of Acute Perforating Ulcer of the Small Intestine* (*Edinburgh Medical Journal* 1925), *Value of Ileocolostomy in Acute Intestinal Obstruction* (*ibid* 1924) and *Note on Operative Treatment of Perforated Gastric Ulcer* (*British Medical Journal* 1926). He was a popular member of the medical profession in Dundee and its neighbourhood, and was unmarried.

SIR JOSEPH FAYRER Bt CBE,

M.D. St. And. F.R.C.S. Ed. Lieut. Colonel R.A.M.C. (ret.)

The death took place at his residence in Gullane East Lothian on April 13, of Lieut.-Colonel Sir Joseph Favrer Bt who for a number of years occupied the position of superintendent of Edinburgh Royal Infirmary.

He was born on March 8 1859. His father was the celebrated Sir Joseph Favrer the first baronet who at one time was surgeon-general I.M.S. and president of the Medical Board of the India Office and who was well known for various medical works dealing with diseases and snakes of India. The son was born in Edinburgh when his parents had returned from India after the siege of Lucknow. He was educated at Rugby and afterwards at Trinity College Cambridge where he graduated B.A. in 1882 taking his M.A. in 1885. Later he studied medicine at St George's Hospital and the Extramural School at Edinburgh and qualified L.R.C.P. and S.E.D. in 1886 taking the M.B. of the University of St Andrews in 1887 and the M.D. in 1889 in the same year becoming also a Fellow of the Royal College of Surgeons of Edinburgh.

He entered the R.A.M.C. as surgeon in July 1886 and was at first medical officer to the Royal Horse Guards and afterwards spent many years on service in India and Hong Kong. He became lieutenant colonel in 1906 and retired from the Corps in July 1911. He first joined the British Medical Association in 1906 and in the following year succeeded to the baronetcy on his father's death. In the latter part of 1911 he returned to Britain and was elected superintendent of the Royal Infirmary of Edinburgh a post which he held until 1923 when he retired. During his military service he had held the posts of secretary to the P.M.O. London District and medical officer to the Duke of York's Royal Military School at Chelsea and before his appointment to Edinburgh had been for two years in command of the military hospitals at Hong Kong. During the war he became commanding officer of the 2nd Scottish General Hospital situated at Craigleith, Edinburgh, and at the close of the war he again took up his duties as superintendent of the Royal Infirmary. In 1919 he received the C.B.E. for war services.

The late Sir Joseph Favrer was celebrated for his charm of manner which endeared him greatly to all those

who served under him. The great success attained by the 2nd Scottish General Hospital was largely due to his unwearying exertions in constantly organizing various forms of service for the soldier patients for whose care he was responsible. In all his dealings he showed a sense of fairness, kindness and an understanding of the point of view of other people. He is survived by his widow the son who succeeds him in the baronetcy and two daughters. The interment took place at Dirleton Cemetery East Lothian, on April 16.

N. C. PATRICK M.R.C.S. D.P.H.

The death occurred in a Belfast nursing home on March 24 of Dr N. C. Patrick, Chief Medical Officer to the Ministry of Home Affairs Northern Ireland after a brief illness. He was a member of a distinguished County Antrim family and was well known to most members of the profession of Ulster for his administrative ability, his gracious personality, and his interest in the profession to which he belonged. He was chosen to act as one of the vice-presidents in the Section of Medical Sociology at the forthcoming Annual Meeting in Belfast, and it is a matter of regret that his unexpected death deprives the Section of a wise officer and useful member.

An intimate friend writes: An outstanding member of the medical profession in Ulster has been removed by the death of Captain Norman Colum Patrick. He was educated at Rossall and was a graduate of Cambridge University receiving his medical training at St Bartholomew's Hospital. He was appointed medical officer of Glenavy Dispensary District in Co. Antrim and subsequently became tuberculosis officer for the county. At the outbreak of the great war he volunteered for active service and as captain in the Royal Army Medical Corps served in France with the 110th Field Ambulance 36th Ulster Division throughout the greater part of the war. After the war he was appointed medical inspector of the Local Government Board of Ireland and subsequently of the Ministry of Home Affairs in Northern Ireland, as Chief Medical Officer. In this capacity he enjoyed the confidence not only of the Department but also of the local authorities with whom he came into close contact. His ability, coupled with a quiet manner and an unassuming disposition gained for him the respect and esteem of all and endeared him to his colleagues and associates in the Ministry who have suffered the loss not only of a wise counsellor but of a loyal friend.

Dr Patrick is survived by his wife (the only daughter of the Lord Chief Justice of Northern Ireland and Lady Moore) and one daughter, with whom there is wide spread sympathy in their bereavement.

Dr HECTOR LEAK who had practised for many years at Winsford Cheshire died on April 10 after a short illness. He was born at Winsford on October 5 1856 the son of A. P. Leak M.D. and received his education at King William College Isle of Man, and Owens College, Manchester qualifying as M.R.C.S. and L.R.C.P. in 1878. Dr Leak during his long life took a prominent part in local public affairs. A justice of the peace for the county of Chester he acted for many years as chairman of the local bench of magistrates. In politics he was a keen Liberal and a supporter of the League of Nations. Before retiring from practice he was senior surgeon to the Albert Infirmary, medical officer to the Post Office and to the Northwich Union. During most of his active years he was a member of the British Medical Association. His son Dr W. M. Leak practises at Winsford thus continuing the long family tradition.

Medical Notes in Parliament

The Army and Air Force (Annual) Bill and the Coal Mines (Employment of Boys) Bill, which had passed the House of Commons, were read a first time in the House of Lords on April 14.

On the same day the House having received a report from the Attorney General on the Liverpool United Hospital Bill read the measure a second time. The Bill was sent to the Committee on Unopposed Bills, the promoters having arranged to make amendments which meet observations made by the Attorney General.

The Education (Deaf Children) Bill the title of which had been amended from Deaf Children (School Attendance) Bill, was read a third time by the House of Lords on April 15 and returned to the House of Commons. The Edinburgh Royal Maternity and Simpson Memorial Hospital Order Confirmation Bill was read a first time by the House of Lords on April 15, and, in conformity with the new procedure on Scottish private legislation was deemed to have been read a second time and reported from Committee.

On April 20 the Maternity Services (Scotland) Bill and the Methylated Spirits (Scotland) Bill were introduced in the House of Lords and read a first time.

The Divorce (Scotland) Bill which has passed the House of Lords was read a first time in the House of Commons on April 19. The Diseases of Fish Bill was reported from a Standing Committee of the House of Commons on April 20.

The Budget

Mr CHAMBERLAIN opened the Budget in the House of Commons on April 20. He announced that the income tax would be increased by 3d in the £ to 5s with additional provision against tax evasion. A National Defence Contribution was proposed on the growth and profits of trades and businesses but not of professions. No increases were proposed in indirect taxation. Mr Chamberlain referred to the report of the Select Committee on the medicine stamp duties. He said he had had many representations from various quarters since its publication and he was having the recommendations of the committee examined in the light of those representations. In view however of the very complex issues involved and the strain on the time of Parliament he did not propose to introduce legislation on the subject in the Finance Bill this year. He proposed to increase the income tax by 3d in the £ and to impose a tax on the growth of profits of all persons engaged in industries trade or business of any kind whose profits in any accounting year ended after April 5 1937 exceeded £2,000. That of course left out small concerns whose profits were at a low level. The tax would not be applicable to professions or employments for although those engaged in employment or in a profession would no doubt benefit by the general improvement he did not consider that circumstances would warrant their inclusion in this charge and indeed the proposal could not be appropriately applied to them. This charge would be called a "National Defence Contribution."

The Budget resolutions were agreed to.

Marriage Bill

The Marriage Bill as amended by a Standing Committee was discussed in the House of Commons on report on April 16. On Clause 2 (Grounds of Petition for Divorce) Mr OSWALD LEWIS moved to insert "persistent before cruelty in the ground has since the celebration of the marriage treated the petitioner with cruelty."

Sir DONALD SOMERVILLE said the Bill would not interfere with the authoritative definition of cruelty as "conduct of such a character as to cause danger to life and limb or health

bodily or mental or such as to give rise to a reasonable apprehension of such danger. If it resulted from one act the House might desire that the act should be a ground for divorce. He recommended the House not to limit the clause as Mr LEWIS proposed.

Lord WOLMER said the Attorney General could not intend one single act however grave should be a ground. Sir DONALD SOMERVILLE said the communication of venereal disease would be a sufficient single act. Lord WOLMER said the subject ought to be treated separately in the Bill. In most cases it involved an act of adultery and so would come under the present law.

Commander AGNEW said that the sub-section in dealing with cases of cruelty where venereal disease was involved would seek to cover cases where a disease of this kind was inherited or acquired accidentally. He would support the later clause which dealt with as a ground of nullity the question of a respondent who was suffering from the disease at the time of the marriage. But it would be difficult to ascertain whether a respondent was suffering from the disease at the time of the marriage and cases of confusion or victimization might arise. He did not believe that because of an accident of this terrible kind a man should have a decree of divorce granted against him.

The proposed amendment was defeated by 130 to 48.

INSANITY AND DIVORCE

Mr TURTON moved to substitute seven years for five as the period after which the spouse of an insane person could sue for divorce. Commander AGNEW said few medical men would be prepared to say after five years that a person was incurably insane. In Western Australia and New Zealand the conditions on which relief from insanity was provided were stricter than those in the Bill.

Sir ARNOLD WILSON said the conditions in the Bill were that the patient must have been continuously under treatment for five years and must after that be subjected to a medical examination which in the opinion of the court proved that he was incurably insane. Doctors would in future be increasingly reluctant to declare that a person was incurably of an old mind. No person who would recover within seven years would be certified by a doctor as incurably insane in the fifth year. There were no sudden changes; it was a question of slow recovery.

Mr BARR pointed out that in the Bill introduced in the House of Lords in regard to Scotland the period proposed was three years. Major NEVEN-SPENCE asked the House to consider the insane persons who broke down during childbirth after a long period of infectious illness, or at the change of life. The excellence of these people's lives might have been a contributory cause yet a long period of treatment was almost inevitable before they were restored to mental health. These cases were capable of being restored. Divorce on grounds of illness was contrary to medical opinion.

The period of five years was retained by 141 votes to 48.

Commander BOWER moved to omit Clause 3 (Definition of Insanity). Sir DONALD SOMERVILLE said the clause merely defined what "care and treatment" meant. Paragraph (b) of the clause dealt with the small class of cases in which for psychological reasons the actual certification was lifted and the person became a voluntary patient. If they attempted to go out or if their relatives attempted to take them away they would be immediately certified again.

Mr BELLENGER asked if the clause would cover the persons who entered an asylum as voluntary patients without previously having been certified. Sir DONALD SOMERVILLE said he thought that class would also be covered subject to the overriding consideration that the court had to be satisfied that such persons were incurably of unsound mind.

Commander BOWER withdrew his amendment. The second of the Bill was adjourned till April 2.

Tuberculosis in Newfoundland

On April 13 Sir JOHN WARDLAW MUIR asked the Secretary of State for Dominion Affairs how many deaths from tuber-

culosis had been recorded in Newfoundland in 1936 and how the figures compared with previous years Mr MALCOLM MACDONALD circulated the following tabular reply

Returns for deaths from tuberculosis in Newfoundland in 1926 are not yet complete but in fifteen out of the eighteen registration districts deaths from this disease totalled 544. This gives a mortality rate of 1.9 per 1,000. The total number of deaths from tuberculosis and the mortality rates per 1,000 of the population in previous years were as follows

Year	Deaths from Tuberculosis (all forms)	Mortality rate per thousand of the population
1925	592	2.3
1926	628	2.4
1927	604	2.3
1928	692	2.6
1929	614	2.3
1930	573	2.0
1931	553	1.9
1932	521	1.8
1933	526	1.8
1934	552	1.6
1935	550	2.0

Debate on Nutrition

On the motion that the House of Commons should go into Committee of Supply on the Civil Estimates on April 13 Mr ROWSON drew attention to the question of malnutrition which he said existed in various parts of the country in a greater or less degree. There were 4,500,000 people who did not spend more than 4s per head per week on food. It was utterly impossible to provide a diet which was body building and strengthening for a child, an adolescent, or an adult on such a figure. He was prepared to admit that sometimes malnutrition among miners was not altogether due to low wages. Malnutrition and a subnormal physical condition might be due to the speed at which they had to work and the heat they had to endure. In the case of mothers and children, especially pregnant mothers, it would be agreed that in the distressed areas there was a good deal of malnutrition. He hoped due notice would be taken of the suffering entailed in so many ways by women. The Minister of Health might do something to get the people to realize what was necessary in foodstuffs. He might also enter upon a poster campaign. That would be a good method of advertising the way in which the people might more profitably spend their money. A group of commodities might be shown and the calories, proteins, and vitamins contained in various foods. Something should also be done to organize the better feeding of children in the schools.

Mr JAMES GRIFFITHS said that one of the best services which the Minister of Health could render would be to make representations to the Unemployment Assistance Board to increase their scales.

NUTRITION ADVISORY COMMITTEE'S REPORT

Sir KINGSLEY WOOD said he welcomed discussion because it gave him the opportunity to call attention to the publication of the first report of the Advisory Committee on Nutrition of the Ministry of Health. He considered that report to be the most valuable document on nutrition that we had had up to the present time. There could be no question as to the authority of the committee: the chairman was Lord Luke and among the members were Mrs Barton Profesor Cathcart, Professor Sir Gowland Hopkins, Professor Mellanby, and Sir John Orr. The report was unanimous. It served a very useful purpose at present in that during the last year or two the question of nutrition had not only been a subject of much discussion but one on which all sorts of statements had been made as to the condition of the nation. Many people had been bewildered and confused by masses of assertions and advice, informed or otherwise. The Advisory Committee said that a great deal of further information had to be obtained before we could reach a final national policy on nutrition.

The report was particularly valuable in that it pointed out a number of ways along which advances could be made. In considering nutrition we must have a right perspective in the sense that while this was an important side it was one side only of our national health problem. Man did not live by calories alone. The national health did not depend only on vitamins, but on better housing, the clearance of slums, maternity and child welfare, the provision of more open spaces and physical recreation.

The Advisory Committee had shown how the consumption per head of most foodstuffs had increased since before the war and gave the proportionate increases in condensed milk, fruit, butter, vegetables, eggs, tea, margarine, and cheese. It said that the consumption of butter and margarine together was now 50 per cent. higher than it was before the war, but on the other side the consumption of cereals had fallen by nearly 10 per cent. since 1913 and milk and cream by about 6 per cent. This increased consumption of foodstuffs was considered by the committee to be evidence of a continued improvement in the national dietary and a rise in the standard of living. The weakest thing to which the committee could point in connexion with the national dietary was the consumption of milk which was on a very low level in this country.

INQUIRIES AND INVESTIGATIONS

The report called attention to two or three inquiries which ought to be made and pending which people ought to suspend judgement. The report was described as a preliminary survey of the whole field and a further investigation into family budgets and matters of that kind was recommended. Accordingly the Minister had asked local authorities to review at an early date their arrangements under the Maternity and Child Welfare Acts for the supply of milk and other foods in view of the importance of securing that the diet of expectant and nursing mothers should contain the proper constituents, and that the consumption of milk, especially by young people, should be increased. He had also drawn attention to the fact that there was to be no question of the limitations which had hitherto been in operation in some areas. He had said that he did not think it desirable to adopt any such restriction for instance as that the supply of milk to expectant mothers should be only during the last two or three months of pregnancy or that children should be supplied with milk only up to the age of 18 months or 2 years or that the limit of supply in every case should be one pint per day. Local authorities had also been asked to review the scale of income used in connexion with the payment for milk and other food supplied. He had added as regards liquid milk that wherever possible a supply of efficiently pasteurized milk should be provided and that where this was not practicable the medical officer of health should approve of the source and quality of the supply. Finally they had been asked to consider afresh the question of a properly organized system of meals. As the block grants to local authorities had been raised by £5,000,000 to nearly £50,000,000 a year and at any rate the rearranged distribution gave a larger share to the authorities whose need was greatest, these authorities would be able to continue and extend the work which they were doing in the direction indicated by the Advisory Committee.

Through the Ministry of Labour an inquiry was being made into family budgets to provide the material required for a revision of the basis of the cost-of-living index. This was going to be incorporated in the Ministry of Labour cost-of-living inquiry. The proposals would involve the collection of budgets from 10,000 families for one week, and from the large proportion of those families for three other weeks, and also supplementary budgets of personal expenditure from wage-earning members of the families. Certain dietary studies were also to be undertaken. Although there was much to be done a great deal had been achieved in the direction of improving the health of the nation in the matter of nutrition. Since August 1931 the biggest milk-in-schools scheme in the world had been started and the Milk Marketing Board in co-operation with local authorities and the Commissioner for the Special Areas had devised schemes for the provision of

milk at a cheap rate for expectant and nursing mothers and for children not of school age. In 1931-2 so far as milk was concerned about 16,472,000 meals were being provided. That figure in 1935-6 had reached 63,710,000. In 1931-2 the figure for free meals was 93,232 and last year it had risen to 406,341. The same proportion obtained for other meals.

DEFICIENCIES OF WHITE BREAD

Mr TURTON said that the Advisory Committee had not dealt with that part of the report of the Technical Commission of the League of Nations which pointed out that white flour in the process of milling was deprived of important nutritive elements. This country was living on white bread and all the beneficial properties of bread were being taken out in the process of milling and the country was being given something very bad for the nutrition of the nation. Other countries had taken drastic action to deal with this bread problem. Every year 36,000 people were dying of tuberculosis and he attached considerable importance to the connexion between the bread we were consuming and the rate of tuberculosis mortality. In the North Riding they had tried to improve nutrition and lower the tuberculosis rate and had been extremely successful. One of the ways in which the tuberculosis officers had dealt with the matter in the North Riding had been to give those suffering from tuberculosis a large proportion of bran in their diet. Surely the Advisory Committee should go into the question of the bread we consumed with great care. He had noticed in the country districts a gradual increase in the consumption of tinned food. He would like the Advisory Committee in their next investigation to inquire more fully into the value of tinned foods as opposed to fresh foods.

Mr E. J. WILLIAMS said that Dr Hastings had recently mentioned the time that was taken in inspecting school children under the school medical service. He was dealing with the London County Council schools. He said that six minutes was the time taken to examine a school child and he complained that it was quite impossible to find out the flaws in a child's health in six minutes. The Minister should consult the President of the Board of Education to see whether something could not be done to give far more accurate information as to school children's state of health than we had at present. We did not really know the physical state of our school children and with such inadequate medical examinations we could not hope to know it. The Minister should insist that the school medical service was treated in a far more scientific way than it was at present.

NUTRITION AND REHOUSING

Mr A. V. ALEXANDER said that the policy which the Government had adopted was not touching the problem. In his book Dr M. G. Gingle had referred to the transfer of the working-class population from slum areas to housing estates. From this it was obvious that it was impossible to hope for a solution of the problem unless with improved housing conditions and the rental charges involved we increased the income of the individual holders whether employed or not in order that they might be able to obtain the minimum standard of nutrition. The Minister seemed to take pride in the fact that there was to be a further inquiry into family budgets. In the Sheffield inquiry, the Liverpool inquiry, the Manchester inquiry, the Salford inquiry, and the inquiry of the British Medical Association we had an abundance of material for any necessary action. It was simply a long-drawn-out process of appointing inquiry after inquiry instead of doing what was essential: enabling the people by improved wages or by increased assistance or by adequate scales for those who had recourse to public assistance to be able at least to purchase the minimum standard of food required to set up a proper basis of nutrition. He hoped the Minister of Health had seen in the *Journal of the Royal Statistical Society* the paper by Mr R. F. George in which he had clearly proved the case that in settling the poverty line now it ought not to be done by the figures of the British Medical Association's scale of two or three years ago. It must be done by the present cost. Mr George had worked out the cost on the basis of the British Medical Association's scale. In 1933 the

cost for an adult meal on that scale was 5s. 11d. per week. On the cost of living index figure for July 1936 that diet would cost not 5s. 11d. but 6s. 9d. and if we examine the change in costs since July 1936 then the cost on the B.M.A. scale would not be 5s. 11d. per week or 6s. 9d. but 7s. 3d.

Mr R. S. HUDSON said he was told that in fact the time taken for the examination of school children was not six minutes. The examination of some of the children took a longer time and that of others less time, the average being six minutes which was adequate for the purpose. Mr Alexander had referred to the results as Dr M. Gingle saw them of the transfer of some neonates from slums to new housing estates. He (Mr Hudson) did not know that that point would be raised or he would have brought some extremely interesting results which had been obtained from investigations made by various local authorities into similar circumstances in their own areas. The general effect was that inquiries were made on a much bigger scale than the one of Dr M. Gingle in Leeds, Manchester, and another large town and it was found that precisely the opposite results had accrued from shifting the population—the mortality rate had gone down and the general health had enormously improved. It was clear that much bigger experiments in large towns such as Manchester and Leeds gave infinitely more valuable results than the very small experiment made by Dr M. Gingle. We could take it that the figures given by Dr M. Gingle were not followed in the rest of the country but that on the contrary the universal experience had been that the people had materially benefited as the result of being shifted from the slums.

Factories Bill in Committee

On April 13 the Standing Committee of the House of Commons which is examining the Factories Bill considered Clause 54 (Lifting Excessive Weights). Mr R. DAVIS moved to omit the words which restricted the clause to young persons. He said that if heavy weight lifting was injurious a restriction of the prohibition to young persons would leave untouched the majority of the accidents. Out of 1,055 weight lifting accidents in a period of three months 1,000 were to adults. Mr BANFIELD, supporting the amendment, said there was a high prevalence of hernia cases among bakers when sacks of flour each weighing 280 lb. had to be lifted by adults. The millers reduced the weight to 140 lb. with a resulting almost total absence of hernia cases among operative bakers.

Mr G. G. LLOYD pointed out that the clause besides prohibiting the lifting by young persons of loads so heavy as likely to cause injury also provided that the Home Secretary could make special regulations prescribing maximum weights which might be lifted, carried or moved by persons employed in factories. Subsection 2 of the clause thereby extended the provision to men but there were powerful reasons why it was not wise to make a purely general provision when the actual circumstances were so complicated. Research had shown that it was not easy to say in general terms how much might safely be lifted. It was desirable to give additional protection to young persons owing to their physical immaturity and mental inexperience. Sir JOHN STURGES said there was at present no general provision in the Factory Code on this subject but in the Children Act a clause stated that a child should not be employed to lift, carry or move anything so heavy as to be likely to cause injury.

Mr R. DAVIS withdrew the amendment and the clause was added to the Bill.

Clause 55 (Prohibition of Employment of Female Young Persons in Certain Processes) was also added to the Bill after withdrawal of amendments to extend this prohibition to the making of bricks and tiles and to the employment of girls under 17 on power presses.

LEAD POISONING AND ABORTION

On Clause 56 (Prohibition of Employment of Women and Young Persons in Certain Processes Connected with Lead Manufacture) Sir ERNEST GRADY LITTLE moved to leave out the limitation to women. He said the suggestion of a ex-

proclivity towards lead poisoning rested on half baked physiology and wholly cooked statistics. The statistics which Miss Margaret Bondfield had quoted on the lead poisoning Bill had proved to be fallacious. The work on this subject which would be accepted in medical circles was that of Dr Collis and Professor Greenwood president of the Royal Statistical Society. Their books stated that there was no evidence to support the suggestion that women were more subject to lead poisoning than men or the suggestion that the accidents which followed in childbirth and so on were due to any sex proclivity. The women concerned objected to this discrimination. The latest knowledge of medicine should be used in framing this Bill.

Mr LLOYD said he realized there might be conflicting views in the medical profession on the susceptibility of women to lead poisoning, but it was not part of the Home Office case that there was greater susceptibility in the case of women. Apart from susceptibility the consequences to women were more serious particularly in maternity. The Home Office was advised that this poisoning was liable to produce abortion. Sir Ernest Graham Little said the mortality was not any higher as a result of maternal poisoning than as a result of paternal lead poisoning. Paternal plumbism would give rise to many miscarriages. The international labour conference had recommended that in view of the danger to maternity and the physical development of children women and young persons women should be protected in this matter. The British Government had undertaken to give effect to that recommendation and could not accept the amendment without breach of international obligation.

Sir Ernest Graham Little's amendment was negatived as was also an amendment by Mr Walker to include alloys containing more than 10 per cent of lead and the clause was added to the Bill.

Clause 57 (Provisions as to Employment of Women and Young Persons in Processes involving use of Lead Compounds) was also added to the Bill. Clause 58 (Power to make Special Regulations for Safety and Health) was also approved. Other administrative clauses were ordered to stand part of the Bill.

NOTIFICATION OF INDUSTRIAL DISEASES

On Clause 64 (Notification of Industrial Diseases) Mr ELLIS SMITH moved to extend the clause to any industrial disease to which the provisions of Section 43 of the Workmen's Compensation Act 1925 apply or silicosis. Mr Smith said chemical processes which were being introduced into industry were reflecting themselves in increasing industrial diseases. He was particularly concerned about silicosis. He was convinced that they were not getting the best out of reports of the Medical Research Council in dealing with these questions. Sir ERNEST GRAHAM LITTLE supported the amendment because the list of diseases which the Bill proposed should be notified to the Chief Inspector of Factories had been transcribed from Section 73 of the Act of 1901 although of the five diseases there included three were practically obsolete and not one case per annum had occurred in the last ten years. Other diseases had come into prominence in the interval. The most fatal cancer of the skin was not mentioned at all.

Sir JOHN SIMON said the amendment raised the question whether the committee should strike the present list out of the Factory Act. Whether the list ought to be revised was another matter. The list of diseases scheduled in the Workmen's Compensation Act differed from the list of diseases notifiable under the Factory Act and the purposes of the two lists was not the same. The object of the list in the Compensation Act was to enable workmen to claim compensation and of the list in the Factory Act to secure prevention. In considering whether a disease should be notifiable under the Factory Act the question was whether the information would be of value to the Factory Department in its effort to prevent the danger. Diagnosis of silicosis was a matter for experts and to impose the duty of notification on the general practitioner would be an inappropriate method of obtaining information which was wanted on the incidence of the disease. To obtain that information the Department conducted special inquiries in industries where there was reason to suspect silicosis such as

industries connected with quarrying and various aspects of mining. A committee of the Medical Research Council had been appointed to continue investigations into industrial pulmonary disease which included aspects of silicosis and the Home Office arranged to obtain information from the Silicosis Medical Board on cases that came to its notice. He was sure the way in which they were proceeding was the better way and he could not consent to substitute in the clause the Workmen's Compensation Act list for the Factory Act list.

The amendment was withdrawn.

MEDICAL REPRESENTATION AT INQUESTS

Clause 65 (Inquest in Case of Death by Accident or Industrial Disease in Factory) was next discussed. Mr MANDER said he wished to permit interested parties to be represented by a medical practitioner so that where a coroner directed a post mortem examination in an inquest under the clause the actual examination would be carried out by a specialist used to dealing with cases of that kind. This matter was the subject of a recommendation in the report of the Departmental Committee on Coroners. Mr GEORGE LLOYD said the question raised concerned the representation of two varying interests by medical practitioners at post mortem examination. He read the observations of the Departmental Committee on the matter and suggested that it should be left to be dealt with by further legislation when it could be looked at as a whole and in perspective. It was undesirable to deal with post mortem procedure in this Bill.

Clause 65 was approved and Clause 66 (Power to Direct Formal Investigation of Accidents in Cases of Disease) was also added to the Bill. On Clause 67 (Duty of Examining Surgeon to Investigate and Report in Certain Cases) Mr LLOYD said he was informed that the certifying surgeons preferred the term examining surgeons and as it was examination rather than certification which was the essential part of their work it was decided to change the designation. The clause was approved.

On Clause 68 (General Conditions as to Hours of Employment of Women and Young Persons) Mr RIDLEY moved to insert a provision forbidding employment of a young person under the age of 15 in a factory and a long discussion followed. Sir ERNEST GRAHAM LITTLE said the nation was going to be faced with a diminution of the number of children in the country, the most important capital that the nation could have. There were other ways than employment in factories for filling the gap between the elementary schools and the age of 15. The committee adjourned until April 15 when the discussion of age of entry into factories was resumed. Mr Ridley's amendment was eventually defeated by 32 to 22. A discussion followed on another amendment by Mr Ridley to make of general application the conditions laid down for women and young persons in Clause 68 in respect of hours worked, periods of employment and intervals for meals and rest. The amendment was defeated by 29 to 16 and the committee adjourned until April 20.

Replying on March 15 to Mr Wilfred Paling Sir JOHN SIMON said he hoped it would be possible to deal in the Factories Bill with the hours of young persons employed in connexion with factories, docks and warehouses whose inclusion in the new Factory Code was recommended by the committee on hours of employment of young persons in unregulated trades. As regards other classes of young persons in whose case the committee suggested an extension of the Shops Act 1934 it would be necessary to introduce separate legislation which could not be undertaken during the present session.

Manchester Hospital and Proposed Employment Exchange

On April 15 Mr FLEMING, Mr ELLIS SMITH, Mr WILKINSON, Mr BENS and Mr LEMLEY asked whether the Minister of Labour had considered the objections to the erection of an employment exchange adjoining the central branch of the Manchester Royal Infirmary. Mr Fleming suggested that the building of this exchange would cause the closing down of the hospital branch for inpatients.

Mr FLEMING BROWN said he was consulting the First Commissioner of Works about proposals made to him informally

on behalf of the board of the Manchester Royal Infirmary. Until the inquiries were complete he could make no statement. He was aware that the medical profession in Manchester objected that the proposed building would obstruct the work that was carried on in the central branch of the Infirmary. At the request of the representative of the Infirmary he had seen him privately and was securing consideration for the matter.

Mr ELLIS SMITH suggested that the Government should take over the site of the Infirmary and make suitable compensation. Mr BROWN said he preferred to make no statement on that at the moment. He could not say whether some proportion of the additional cost incurred by the hospital authorities in removing the branch would be repaid to them.

Sir KINGSLEY WOOD, answering Mr Ellis Smith on the same subject, said he had received representations from the hospital on the proposed erection of the central employment exchange but he had no powers in the matter. When in Manchester recently he had seen the site and the officials.

Corporal Punishment of Juveniles

Sir JOHN SIMON told Mr Muff on April 15 that names were under consideration for service on the committee to inquire into the administration of corporal punishment for juvenile delinquents. The scope of the committee's inquiry would cover also the question of corporal punishment imposed on adults whether by sentence of the criminal courts or by the prison authorities as part of the system of prison discipline.

Coroners' Comments

Lord MORRIS in the House of Lords on April 15 asked whether the Government was prepared to curb by legislation the tendency among coroners to moralize and lecture at the inquests over which they presided or alternatively to abolish the office of coroner. He said the matter had been before a Commission of Inquiry in 1935. The coroners' inquest was unnecessary and a growing volume of opinion favoured its abolition.

Lord DUFFERIN for the Government said the Home Office knew of no increasing tendency of coroners to moralize and lecture. There were 3,500 inquests yearly in London and he knew of no complaint against a coroner's conduct at any during the last year. The Home Office took a grave view of reflections on people who were not represented in court or at institutions which had not counsel to represent them. A circular to that effect had been issued to all coroners by the Home Office in 1927 and the subsequent recommendations of Lord Wright's committee were brought to their notice. Lord Wright's committee had said that on that particular point no legislation was required but when opportunity offered the suggestions of that committee would probably be the subject of legislation. The Government however could not contemplate the abolition of the office of coroner.

Welfare of Crews of Merchant Ships—Mr RUNCIMAN replying to a question on April 13 said that the recommendations of the Shipping Federation Committee for the welfare and comfort of the crews on merchant ships were now being generally adopted by shipbuilders and owners and were substantially incorporated in a revision of the Board of Trade Instructions to their Surveyors which was now under consideration by the Merchant Shipping Advisory Committee.

Approved Societies and Unemployed on Extended Insurance—An April 13 Mr JOYNTON asked the Minister of Health whether he was aware of the administrative difficulties of many national health approved societies which had a large proportion of unemployed members on the extended insurance period and for whom these societies only received half the administration allowance and whether he could make any announcements supplementing that allowance. Mr ROBERT HODSON said that the Minister had considered the representations made to him on the subject and had found it possible for the allowance to be increased by 50 per cent. as from the beginning of the present year.

Medical News

The ninety seventh half yearly dinner of the Aberdeen University Club London will be held at the Café Royal Regent Street W on Thursday April 29 at 7 for 7.30 p.m. followed by dancing from about 9.45 until midnight. The chairman of the evening will be Sir Peter Chalmers Mitchell, C.B.E., LL.D. F.R.S. and the chief guest will be Sir Benjamin Robertson K.C.S.I. K.C.M.G. LL.D. The honorary secretary's address is 51 Harley Street London W.1.

A lecture on 'Hypnosis Suggestibility and Progressive Relaxation An Experimental Study' will be delivered by Dr William Brown before the British Psychological Society at the London School of Hygiene and Tropical Medicine Keppel Street W.C. on Thursday April 29 at 8.30 p.m.

The committee entrusted with the arrangements for a memorial to the late Dr Carey Coombs in conjunction with the Bristol Medical-Chirurgical Society has arranged with Mr Laurence O'Shaughnessy F.R.C.S. to deliver a lecture on "The Operative Treatment of Cardiac Ischaemia." This will be given at 8.30 p.m. on Wednesday May 5 in the Physiological Lecture Theatre of Bristol University.

A new wing at the City of London Hospital for Diseases of the Heart and Lungs Victoria Park F. will be opened by Queen Mary on April 29. An appeal for £25,000 has been made for the provision of the new wing and Queen Mary has consented to receive at the opening ceremony purses given towards this sum.

The Lord Mayor of London and the Lady Mayoress have issued invitations to a festival dinner for the National Hospital for Diseases of the Nervous System Queen's Square to be held at the Mansion House on Tuesday April 27 when H.R.H. the Duke of Kent will be present.

A meeting of the Medical Section of the British Psychological Society will be held at 11 Chandos Street Cavendish Square, W. on Wednesday April 28 at 8.30 p.m. when Dr Jane Suttie will read a paper on 'Biological Echoes in Clinical Psychotherapy.' A discussion will follow.

A quarterly court of the directors of the Society for Relief of Widows and Orphans of Medical Men was held on April 7 with Dr C. Kempster vice president in the chair. The deaths of three members were reported and five new members were elected. A donation of £111 has been received from the Royal Medical Agency. A first application for relief was received from a widow of a member. The court voted her a yearly grant of £50 from the ordinary funds and one of £25 from the Brickwell Fund. The number of widows in receipt of relief has now reached a total of sixty which is the largest number to be dependent on the society at any one time. One of these widows celebrated her nineteenth birthday in March. She has been on the funds for forty one years and has received over £3,000 from the society. This is but one of many examples of the benefit that may be obtained by membership. Relief is only given to the widows or orphans of deceased members. £66 has been received from the Inland Revenue representing the return of income tax for the year ended April 5. The annual general meeting of the society will be held on May 19 at 5 p.m. Membership is open to any registered medical man who at the time of his election is resident within a twenty mile radius of Charing Cross. Full particulars may be obtained from the secretary at the offices of the society 11 Chandos Street Cavendish Square W.1.

Letters, Notes, and Answers

All communications in regard to editorial business should be addressed to THE EDITOR BRITISH MEDICAL JOURNAL B.M.A. HOUSE TAVISTOCK SQUARE W.C.1.

ORIGINAL ARTICLES and LETTERS forwarded for publication are understood to be offered to the *British Medical Journal* alone unless the contrary be stated. Correspondents who wish notice to be taken of their communications should authenticate them with their names not necessarily for publication.

Authors desiring REPRINTS of their articles published in the *British Medical Journal* must communicate with the Financial Secretary and Business Manager British Medical Association House Tavistock Square W.C.1 on receipt of proofs. Authors or editors should indicate on MSS if reprints are required as proofs are not sent abroad.

All communications with reference to ADVERTISEMENTS as well as orders for copies of the *Journal* should be addressed to the Financial Secretary and Business Manager.

The TELEPHONE NUMBER of the British Medical Association and the *British Medical Journal* is EUSTON 2111.

QUERIES AND ANSWERS

Sleep Rolling

Dr H. STIVEN (Cairo) in reply to J. M. C. (*Journal* March 27 p. 694) writes: Try Coué's method of talking quietly to the child loud enough for the subconscious mind to hear but not loud enough to wake the child. Tell him to keep still over and over again about twenty to forty times each night and in two or three nights the habit will be cured.

Ownership of a Medal

Mr T. A. ANDERSON (Central High School Beaufort West S. Africa) writes: With reference to the inquiry by Dr Norman Klass in your issue of November 21, 1936 (p. 1066) about the bronze medal picked up in this district, you may be interested to hear that I have succeeded in tracing a daughter of the late Dr L. J. Newnham in this country and have now restored the medal. Her father came out to practise in South Africa at one time at Malmesbury later farther inland. He died in 1918 at the age of 67. The medal must have lain for years on the shelf. I have not yet succeeded in accounting for its presence in these parts. Charing Cross Hospital may be interested in the above information.

External Use of Iodine

Colonel R. J. BLACKHAM (London E.C.4) writes: As author of a first aid manual which has passed through very many editions and is still used for ambulance classes in India I have been particularly interested in the correspondence opened by Dr J. C. Macaulay in the *Journal* of February 13 (p. 374). Dr Macaulay has been at pains to point out that he did not mean to convey in his first letter that iodine was useless but that it does not suit some cases but some writers who have followed him have been unequivocal in their complete condemnation. The use of iodine known for so many years as the surgeon's wooden sword as a skin antiseptic is very well established but I think all recognize that the drug is an irritant—in fact much of its value is due to this fact. Hale White in the book which has served so many generations of students says it is a disinfectant and irritant so Dr Macaulay has only called attention to a quality of iodine which has been drummed into his pupils by every professor of pharmacology. This is agreed but when it is suggested that the action of the drug is superficial your correspondents are on debatable ground since authorities such as Cushing contend that it penetrates into the deeper layers of the skin. The most recent books on surgery continue to advise an alcoholic solution of iodine in preparation of the skin for operations. For instance Rowlands and Turner speak of "the remarkable power which the solution possesses of destroying the cutaneous

organisms" (1936 eighth edition p. 18). Again Rose and Carless's *Manual of Surgery* another students' bible with regard to skin preparation for operations, says: "A 2 per cent solution of iodine in 95 per cent of alcohol is painted over it [the skin] and allowed to dry and a sterile dressing applied. The painting with iodine is repeated once again at the time of the operation." I fully endorse the views of those correspondents who have emphasized the value of spirit and frizz balsam for the first aid treatment of wounds but I think they are inferior to iodine. I would like to call attention to the difficulties in carrying liquids when travelling. It is always the iodine bottle which gets broken and I have suffered much loss from such breakages. For some years past I have always carried unguentum iodintinctum or rather a proprietary article of the same class. I have found this preparation entirely satisfactory for first aid treatment of wounds and abrasions and the iodine which it contains certainly does penetrate.

Income Tax

Deduction for Rent

J. S. has for some years been allowed a deduction of £22 a year—that is one half of £44 the amount of rent payable before he bought the property. The inspector of taxes states that the deduction should have been one half of £34—that is £17—as £34 is the amount of the net Schedule A Assessment.

* * The inspector is correct where property is owned the rent should be reckoned for that purpose at the amount of the net Schedule A assessment. But J. S. is entitled in addition to deduct the amount of any expenditure on repair or decoration of that part of the premises which is used for professional purposes.

LETTERS, NOTES, ETC

Herpes Zoster and Varicella

Dr F. A. E. SILCOCK (Leicester) writes: I was much interested in the report of another case of herpes zoster and varicella by Dr J. G. Bennett in your issue of April 3 (p. 738) as I published a case of Herpes Zoster Brachialis with concurrent Varicelliform Eruption together with two photographs of the case and a few references to the literature in the *British Medical Journal* of July 22nd 1933. My case however was in a man aged 74 years. Following my communication there were several others who wrote and described the coincidence of the two conditions.

Vincent's Angina

Dr EUSTACE THORP (Sunderland) writes: I have been seeing lately quite a number of cases of Vincent's angina all of which have been bacteriologically confirmed and nearly all have been bilateral. This would seem to discount the general opinion that the disease is characterized by being unilateral.

Iodine in Pulmonary Tuberculosis

Dr W. O. C. HUNT writes: Recently I have been treating cases of pulmonary tuberculosis with graduated doses of triiodine giving as a maximum 5 minims three times a day. The results have been amazingly good. In a busy general practice the opportunity for studying these results are not so good. I wonder if some one in a suitable place for observation would give this treatment a trial.

Protamine Zinc Insulin

We have received from Messrs Boots a copy of their new booklet on protamine insulin (with zinc) suspension. This gives details of standardization and testing together with clinical results, the dosage for new and old cases of diabetes and particulars of the modified diet which should be used when changing over to the new treatment. The booklet concludes with a useful list of references to recent papers. Copies may be had on application to the Wholesale and Export Department Boots Pure Drug Co. Ltd. Station Street Nottingham.

Disclaimer

Dr W. A. BURNETT writes disclaiming any responsibility for or connexion with correspondence referring to him and his work appearing in the *Northern Rhodesian Advertiser*.

EPITOME OF CURRENT MEDICAL LITERATURE

Medicine

318 Spontaneous Recovery in Schizophrenia

A. FAURBYE (*Nord med Tidsskr* February 6, 1937 p 206) draws attention to the need for accurate information with regard to the frequency with which spontaneous recoveries from schizophrenia occur. Only with such information is it possible to gauge approximately the value of the various new remedies advocated for this disease. As recoveries under ordinary institutional treatment and occupational therapy can be anticipated only in the first few years of the disease the author has chosen such comparatively early cases for his study at a mental hospital in Denmark. In November, 1936 he made up the therapeutic balance sheet of seventy-two patients whose disease was of comparatively recent origin and whose admission to the hospital dated at least one year back. These patients were cases of simple or katatonic dementia praecox etc. Of the forty patients discharged from the hospital as many as thirty had more or less recovered. A similarly high proportion of spontaneous remissions has been observed in several other mental hospitals to judge by the literature, and Lange found seventy-seven remissions among 100 cases. The author considers his own proportion of remissions (42 per cent) as an underestimate for of none of the patients still in his hospital could it be assumed that remissions would certainly not occur later. The proportion of remissions was highest in the katatonic group in which the best recoveries were observed. The author commends his observations as a sobering corrective to the enthusiastic advocates of new methods of treatment whether they be by Sakel's insulin-shock or by any other process.

319 Carcinoma of the Lung

O. FEUCHTINGER (*Z. Tuberk.* Ed 77 Heft 2 1937 p 81) discusses the aetiology and differential diagnosis of carcinoma of the lung, with special reference to ten personal cases. He finds no proof for the belief that tuberculosis and carcinoma cannot coexist or for the theory that carcinoma arises necessarily from a precancerous condition occasioned by tuberculosis. Only three of his cases had tuberculosis and in none of them was it associated in any way with the carcinoma. He suggests that when tuberculosis and tumour coexist this might occur because of a simultaneous appearance of both (very rarely) because an old tuberculous lesion develops into a cancerous one (rarely) or more commonly because a latent or active tuberculosis turns to carcinoma or a carcinoma activates tuberculosis. Tobacco appeared to have some significance for seven of the author's patients were heavy smokers. The ratio of men to women was 8 to 2 confirming the findings of other authors. Heredity appeared to be significant for four patients with a family history of cancer three had cancer of the lung. Aetiological factors mentioned by other authors—for example, dust profession habitat avitaminosis war conditions etc.—were not found in Feuchtinger's cases. He admits that the differential diagnosis is difficult but maintains that diagnosis is possible in 50 per cent in the first and 80 per cent in the later stages of the disease. A ray examination bronchoscopy and exploratory thoracotomy yield the best results in differential diagnosis. In the history the presence of possible aetiological factors especially occupational ones may help. Physical examination rarely allows of differentiation between cancer and tuberculosis (all ten cases had been diagnosed as tuberculous). The presence or absence of tubercle bacilli in the sputum does not exclude the occurrence of cancer but bloody sputum in the absence of tubercle bacilli in elderly people is strong presumptive evidence of cancer. Tumour cells are only rarely found in the sputum. Haematological and serological tests are only of value in conjunction with

other evidence. Increasing pain and dyspnoea in the thorax after tapping of a pleural exudate is in the author's opinion very suggestive of the existence of carcinoma.

320

Obesity in Women

T. BOTELHO (*Ann. bras. Gynec.* January 1937 p 25) maintains that a sharp distinction cannot be made between constitutional and acquired obesity, the neuro-endocrine factor being the important cause of the obesity. Two definite glandular groups may be distinguished—namely, an excito-anabolic group (pancreas anterior lobe of hypophysis adrenal cortex thymus spleen and parathyroids) and an excito-katabolic group (thyroid posterior lobe of hypophysis adrenal medulla testicle, and ovary). The preponderance of either of these groups may lead to obesity. Feminine obesity may appear in two different clinical types—namely a superior type in which the upper half of the body is affected and an inferior type in which the lower half of the body is involved. In the first type thyroid deficiency predominates. Three subtypes of the second type may be described—namely the Rubens type, the breeches type and the pantaloons type—according as the fat develops above the trochanter at its level or below it. In all three subtypes there is an ovarian deficiency. In dienecephalo-pituitary deficiency the fat involves the proximal ends of the upper and lower limbs. As regards treatment, Botelho regards regulation of the diet to suit the individual basal metabolism as most important and alludes to risk of the occurrence of deficiency diseases in restrictive diets. The key to the dietetic treatment of the obese patient consists in a proper amount of glycides and a minimum quantity of proteins and lipids. Thyroxine oestrin and progesterin are valuable aids in the different types of obesity. Protein therapy stimulates the glandular system while dinitrophenol increases the metabolic rate. Care should be taken in the administration of mercurial diuretics. Gymnastics and massage are useful subsidiary measures.

Surgery

321

Paget's Disease of the Breast

L. CLARENCE COHN (*Arch. Surg.* Chicago February 1937 p 201) draws attention to the evidence presented by Bloodgood in 1924 that Paget's disease of the female nipple may be a preventable disease and curable in its early stages. Although the lesion is comparatively uncommon the author has observed in the last two years five cases from which he draws several conclusions. It was noticed that there is no clinical difference between a small benign lesion of the nipple and one which shows fully developed Paget's carcinoma. If such a lesion does not heal with cleansing and protective measures a biopsy should be performed. This should consist of complete excision of the nipple the areola and the central zone of the breast beneath. Fully developed cancer of the nipple may be present without a fissure or ulcer; there may be only slight keratosis surrounded by an area of irritation the lesion being confined to the nipple only. When biopsy shows Paget's carcinoma complete removal of the breast should follow although pre-operative irradiation of the supraclavicular area axilla, and breast may be carried out. When an ulcer on the nipple is associated with a palpable mass in the breast or with palpable axillary glands one course of pre-operative irradiation may be given but when only an insignificant lesion of the nipple is present irradiation should not be done without a previous biopsy as an ulcer which is the previous seat of cancer may heal under treatment leaving the cancer in the breast and axillary glands unobservable. No conclusion has been come to as regards the increase of cures by the addition of pre-operative irradiation. Nine cases of Paget's cancer of the nipple are described and of these

four were clinically malignant and in five the diagnosis was settled by biopsy. Of the four patients who in addition to an ulcer of the nipple had a mass in the breast three died within a year and five months. Of the five cases in which the lesion was confined to the nipple one patient died more than five years after operation while three are living and well from one to five years after operation. The fifth patient was followed for five years and was then lost sight of. Comparison of the results in these two series shows that operation to be successful must be in the early stages while the lesion is still confined to the nipple.

322 Epicondylar Fractures of the Elbow

J. VERBRUGGE (*Scalpel Liège*, February 20 1937 p 225), in advocating the surgical treatment of epicondylar fractures of the elbow with displacement gives many reasons in favour of operation as compared with other methods of treatment. Intervention is short lasting not more than twenty five minutes at most. Reduction is easy as the fracture is exposed to view. Immobilization can be carried out at an early date. Dressing after operation is simple and the result of this treatment is a lasting and firm reduction of the fracture. Other methods entail immobilization for a long period, the wearing of an apparatus, repeated manipulations and radiography, and sometimes a second reduction if the anatomical result is not satisfactory. A review is given of thirty one cases of epicondylar fracture in children between the ages of 6 and 15 years. Of these ten were fractures without displacement, and were treated by immobilization in plaster with satisfactory results in all cases. There were seventeen cases of fracture with displacement and of these four were treated without operation with varying results. The remaining seventeen cases in the series underwent operation and in every case healing was by first intention, without fever, suppuration, or any nervous complications. The after results in sixteen cases showed the complete recovery of movement in the elbow and the joint was quite normal. In one instance where the fracture was of six months duration before operation was carried out there was a reduction of 20 per cent in extension and slight varus. The article is fully illustrated and the operative technique described. Emphasis is laid on the advisability of fixation by means of nails. Early operation is recommended especially in the case of children as the formation of callus which may take place in under ten days makes the repairing of the surfaces of the fracture more difficult. Immediate operation is necessary in cases with nervous complications.

323 Value of Individual Fingers

W. PORZELT (*Zbl. Chir.* March 6 1937 p 550) disagrees with the almost universally accepted view that the first finger is the most important after the thumb and that the rest decrease in value according to their numerical order. He points out that when the phalanges and metacarpals with their respective muscles are taken as an anatomical unit the middle finger becomes more important than the first. Because the strong adductor pollicis arises from the third metacarpal, loss of the second results in greater weakness of the hand than loss of the first finger with its metacarpal. Porzelt holds that the little finger, owing to the origin of the opposing muscles from the fifth metacarpal, holds the third place in the value of the fingers. The ring finger is the least useful. Loss of the first finger by no means results in irreparable damage to the function of the hand. The author has satisfied himself that with a little practice the hand's cunning for work, entailing complex movements can be regained. He is of the opinion that the traditional fear of sacrificing a healthy first finger in repairing a damaged thumb is unfounded. He regards as justifiable the attempt to replace a mutilated thumb with the first finger in conjunction with the second. More is to be gained thereby than by leaving the first finger intact.

500 n

Therapeutics

324 Hypertonic Saline in Migraine

G. VILLEY and J. BUVAT (*Paris med.* February 27 1937 p 189) draw attention to an article published in 1934 describing three cases in which epileptic patients were treated with intravenous injections of hypertonic saline. As a result of the success obtained in these cases this method of treatment has been tried in migraine crises with interesting results. Three cases are reported in which the symptoms were similar—violent headache, vomiting, depression and general malaise. Injection in each case brought about an almost immediate cessation of symptoms, and in one case the patient was able to resume work a few hours after treatment. The cases treated in this way are not sufficient for any definite conclusions to be drawn, but it is suggested that the success in these three instances justifies the authors in continuing with this method of treatment in any suitable cases, and also in trying the effect of hypertonic injection as a preventive measure in patients suffering from shock or other crises likely to lead to migraine.

325 Adrenaline in Malaria

M. ASCOLI (*Munch. med. Wschr.* March 5, 1937, p 370) administers adrenaline for the treatment of malaria in daily intravenous doses beginning with 1/100 mg and increasing the dose by 1/100 mg daily until it reaches 1/10 mg. The latter dose is repeated for about three weeks. The best results have been obtained in chronic malaria, with splenomegaly, anaemia, and cachexia. It has also been of value in fresh infections. Resistance to quinine often disappears and the quinine dosage can be lowered when adrenaline is employed. Adrenaline, as affecting the contractility of the spleen, has been used in the treatment of splenomegalies other than of malarial origin. Ascoli maintains that adrenaline cures the malarial patient by sterilizing the spleen and making relapses through further protozoal invasion impossible. Of fifteen patients treated two years ago and twenty one year ago none show enlargement of the spleen again and none have relapsed. Evidence is accumulating which proves that the adrenaline treatment raises the resistance of patients to malarial infection. Few cases have been resistant to treatment. In some an increased dosage has achieved success. The author points out that adrenaline only reduces congestive enlargement of the spleen. Fibrotic changes in it are left uninfluenced.

326 Insulin Shock in Schizophrenia

E. KÜPPERS (*Dtsch. med. Wschr.* March 5 1937 p 377) has treated sixty nine cases of schizophrenia with insulin hypoglycaemic shock on the lines laid down by Sakel of Vienna. In thirty-four cases the treatment was completed and in the remainder it was still being continued. Among the thirty four cases were eight in which this treatment was followed by complete remission—that is the disappearance of every abnormality indicative of schizophrenia. In fifteen cases improvement was achieved, seven of these patients being able to return to their work and three being fit enough to be discharged, while the remaining five had not improved so much. Professor Küppers is so pleased with this proportion of complete and incomplete recoveries that he considers them far better than those achieved by earlier methods of treatment and he thinks there can be no doubt as to the outstanding merits of this treatment. A distressing sequel in one of his cases was an intestinal catarrh which after its acute phase had subsided became chronic. Another undesirable effect of this treatment is its diminution of the patient's resistance to infections and it was often necessary to discontinue the treatment because of sore throats or boils. These drawbacks should not, however, disqualify patients from receiving the treatment.

which should be started as early in the disease as possible. Much can be done to minimize the ill effects of the treatment by giving the patient a whole holiday from it on certain temperature indications which the author describes in detail. He has not yet had any deaths from it and to judge from the recent literature of some 400 cases the mortality from this treatment can be put at about 15 per cent (six deaths). In consideration of the benefits of this treatment and the seriousness of the disease this mortality should be accepted as a worth while risk.

Ophthalmology

327

Sympathetic Ophthalmia

D. H. TROWBRIDGE, jun. (*Amer J Ophthal* February 1937 p. 135), reports on thirty-two cases of sympathetic ophthalmia. Most perforating injuries and most cases of sympathetic ophthalmia occur between October and April, this fact may be related to occupational pursuits. Most of the cases had soft exciting eyes. One case resulted from an exciting eye with fifteen years post-operative irritability, and another followed a non-perforating injury to an eye perforated fifteen years previously; one occurred nineteen years after the injury. The earliest inflammation was twenty-three days after injury. The vision of either eye at the onset of the inflammation gives no indication of the outcome nor were the cases with a ciliary wound predominant. Delayed or incomplete healing may justify an unfavourable prognosis. Early removal of the exciting eye after the appearance of sympathetic ophthalmia leads to a more favourable outcome. Photophobia and ciliary injection are the earliest signs in the sympathizing eye. Of the eight post-operative cases four followed cataract extraction. There were two instances of choroidal sarcoma with no operation or wound having caused sympathetic ophthalmia and three cases followed purulent infections. Discussing the pathological findings very fully it is noted that little prognostic help can be obtained from the extent or situation of the infiltration in the exciting eye. It is possible that enucleation with a long piece of optic nerve may afford better protection than evisceration. One case responded favourably to the elimination of a focus of infection and two others to irradiation with ultra violet light.

328

A Test for Aniseikonia

D. G. ALLR (*Arch Ophthal* Chicago February 1937, p. 320) points out that eyes can perceive a difference in size of retinal images of less than 0.25 per cent, that a difference in size insufficient to prevent fusion may cause eye strain and that in some cases images may be equalized by altering the base curve and thickness of lenses. He describes a stereoscope with rotary prisms and special targets for determining aniseikonia. A difference of 1 dioptre between spectacle lenses causes aniseikonia of 2 per cent, one of 2 dioptres gives 4 per cent and 3 dioptres difference results in 6 per cent difference in image size. Eye strain tends to appear if there is over 2 per cent of aniseikonia unless suppression of one image occurs and it is in these cases that size lenses may prove of value in equalizing the images and restoring stereopsis.

329

Kerato-conjunctivitis Sicca

E. AND T. DALSGAARD NIELSEN (*Læskr Læg* February 25, 1937) give an account of seven patients suffering from kerato-conjunctivitis sicca which they regard as a disease sui generis. In their experience, and according to the literature it is practically limited to women over the age of 40. It is bilateral and characterized by hyperaemia of the conjunctivae, reduced tear secretion, thickening of the epithelium of the cornea, a sense of

itching or burning, photophobia, reduced acuity of vision, dryness of the mouth and hoarseness. In five of the authors' cases there was a history of rheumatism of the joints or muscles, and of the two cases in which the temperature was taken over a considerable period one was found to be slightly febrile. The onset of the disease was insidious in every case and its further course was chronic and progressive. While four of the patients had been reduced to a state of chronic invalidism by the local phenomena and the associated general ill health, the other three were but little disturbed by this ailment, the treatment of which has hitherto achieved little. The recognition of its true character is however desirable and it must not be lightly dismissed as a manifestation of climacteric nerves. The authors have studied the nasolacrimal reflex in this disease and come to the conclusion that it is due to a chronic infection of the vegetative nervous system leading to hypofunction of certain glands. Considering the sex and age of the patients these glands seem to be connected with the sex functions of women.

330

Prevention of Ocular Complications in Tryparsamide Therapy

M. FINE AND H. BARKAN (*Amer J Ophthal* January 1937 p. 45) attribute the distrust of this therapy to the possibility of damage to the optic nerves. Possibly a very slow elimination of the drug in some cases causes a cumulative effect. Clinically the visual field rapidly contracts; good central vision remains, there are subjective symptoms and a slow appearance of atrophy. But recovery is prompt on stopping the drug. A pre-existing syphilitic lesion of the optic tract does not necessarily preclude tryparsamide atrophy, but pre-existing atrophy or the field contraction of early atrophy constitute to many writers a definite contraindication to the therapy, though there is no evidence that such lesions are aggravated by tryparsamide treatment. There is no connexion between dosage and the incidence of atrophy. It should be remembered that in neurosyphilis subjective examination is unreliable and that central vision being preserved the may not appreciate early changes in the peripheral field. Fundus changes appear three to six weeks after various loss of vision or field. Early field changes, therefore though difficult to elicit should be taken as the danger signal. The fields fundi and vision should be examined before the first, third, fifth and tenth and then before every successive tenth injection. At other times subjective symptoms call for examination of the vision and field. Any objective disturbance is an indication for termination of the treatment.

331

Intracranial Venous Sinus Thrombosis

F. B. WALSH (*Arch Ophthal* Chicago January 1937 p. 46) divides thrombosis into aseptic which characteristically occurs in non-paired sinuses, tends to organize or thrombose, is rarely associated with meningitis and is followed in half the cases by cerebral extravasation and softening, and septic found in paired sinuses, often followed by meningitis and cerebral abscesses, rarely associated with cerebral extravasation and always accompanied by surrounding lymphangitis. In septic thrombosis of the cavernous sinuses there is chemosis and exophthalmos, the latter dependent upon extension forward from the cavernous sinus and vascular obstruction. The edema of the lids is more marked in the upper lid especially if the infection begins anteriorly. External ophthalmoplegia is rarely in fulminating cases. Paralysis of the external is the first sign of involvement of the trochlear nerve. If the ophthalmoscope gives little help in diagnosis, a retrobulbar injection and slight pupil dilation may be of value. The prognosis is many cases has no fundus changes. The author describes six cases. Post-mortem he found a bacterial infection, oedema of the retina, thrombosis of the

the choroid, slight papilloedema, and hypophyseal necrosis. Thrombosis of the longitudinal sinus usually occurs in debilitated infants and is frequently accompanied by Jacksonian convulsions. Conjugate deviations are common, while papilloedema and vascular engorgement of the scalp retina, and conjunctiva are inconstant. The signs of increased intracranial pressure come on abruptly, fluctuate, and are non-progressive. In thrombosis of the lateral sinus bilateral papilloedema occurs often but does not indicate a grave prognosis. Sixth nerve paralysis indicates forward extension via the inferior petrosal sinus.

Obstetrics and Gynaecology

332 Simple Biological Pregnancy Test

N J KUSTALLOW (*Zbl Gynäk* January 30, 1937, p 269) has found that addition, to a fluid extract of hay, of the urine from a patient with an early uterine or an ectopic pregnancy causes in 30 to 90 seconds a cessation of motility in the ciliate infusoria (*Paramecium caudatum*) which are present and previously moved actively in straight lines. The immobilization, observed without use of a cover-glass is preceded by a substitution of linear by rotatory movements, in some cases by finely granular disintegrative changes and by a transference of the infusoria to the periphery of the preparation. It is but little affected by boiling the urine. The movements are unaffected by the urine of non-pregnant persons. A positive test is given in abortion so long as products of pregnancy remain, and in ectopic gestation the immobilization appears to occur more quickly than in uterine pregnancy. Since a degree of slower immobilization occurs in some pregnancy toxæmias (excluding eclampsia) and in septic gynaecological conditions, it would seem that a negative outcome of this test, for which further trials are asked, is of greater diagnostic significance than a positive

333 Caesarean Section

C J DUNCAN AND J B DOYLE (*New Engl J Med* January 7, 1937, p 1) present a ten-year study of Caesarean section (1926 to 1936) at the Boston City Hospital. In 22,880 deliveries 703 sections were performed with a mortality rate of 4.3 per cent. There were in all sixty-three operators of whom twenty-four were visiting surgeons, the remainder being house surgeons. The transverse cervical operation was most favoured, there being 480 cases, with a mortality 3.5 per cent, the classical section was done in 133 cases with a mortality of 6.1 per cent and in 70 operations in which the incision was a longitudinal one through the cervix the mortality was 7.1 per cent. There was a marked difference in the mortality rates of primary and repeated section—as compared with 6.8 per cent to 1 per cent—this being explained by the fact that repeat sections were done without previous vaginal examination. The indications for operation were extremely variable covering all varieties of toxic pregnancy and obstructed labour. It was noticeable that in the cervical sections lengthening of the time allowed for trial labour may be permitted.

334 Hyperfollicular Haemorrhage

R JOACHIMOVITS (*Wien klin Wschr* February 26, 1937, p 257) points out that the diagnosis of uterine haemorrhage due to follicular hyperactivity is essential for correct therapy. It is made in four ways (1) Five castrated mice are injected with 0.8 c.c.m. of urine five times in the course of two days. Forty-eight hours afterwards three vaginal smears are made and examined. 0.02 mg. folliculin per litre is sufficient to give positive results. The method is impracticable except in well-equipped laboratories. (2) Vaginal smears are examined. In cases of hyperfollicular haemorrhage the vaginal discharge shows the same characteristics during the menses and for some time afterwards

as that in the normal woman during the ninth to twelfth days from the onset of the period. These characteristics are cornification of the vaginal epithelial cells; many large columnar epithelial cells with small pyknotic nuclei lying together in groups; leucopenia; and much mucus. If the haemorrhage is continuous a check pessary is introduced to keep the vagina free of blood for a short time, thus avoiding contamination of the smear. (3) Mastalgia is present in a large proportion of cases of hyperfollicular haemorrhage. Experimentally it has been shown that folliculin produces swelling and pain in the breast, and in therapeutic administration of folliculin mastalgia denotes overdosage. (4) Histological examination of the uterine mucosa reveals, in cases of hyperfollicular haemorrhage the characteristic picture of the proliferative phase. Sporadic cases of hyperfollicular haemorrhage occur during the child bearing period, but the vast majority occur one to two years before the climacteric, at a time when physiologically large amounts of folliculin are being continuously produced. Provided that no other signs are elicited on careful palpation, conservative treatment will be indicated in the majority of these cases.

Pathology

335 Toxicosis Produced by Cereals

L A TSCHERKES (*Arch Sci Biol* 1936, p 13) has investigated the influence on animals of a predominantly cereal diet. The animals developed pathological conditions notwithstanding the addition of milk, yeast, and cod liver oil to the diet. The symptoms of the disease varied according to the animal species. White mice showed skin lesions, accompanied by necrosis of the helix toes, and tail. In rabbits there was a predominance of paralysis and convulsions while rats succumbed without any definite outward symptoms. As the diet contained all the known vitamins the pathological conditions could not be considered as deficiency diseases, and must be regarded as alimentary toxicoses.

336 Irradiation of Mouse Sarcoma 180

KANEIATSU SUGIURA (*Radiology* February, 1937, p 162) has investigated the effect of x rays of 200 kilovolts on mouse sarcoma 180. He irradiated *in vivo* tumours 0.3 to 1.5 cm in diameter through a hole slightly larger than the cross section of the tumour in a lead shield 5 mm thick. No tumour regressed with a dose of less than 500 r units and very few with less than 750 r units. With a dose of 1,000 r units about half of the cases showed complete regression, but with a dose greater than 1,500 r units tumour regression occurred in almost 100 per cent of cases. The lethal dose for the tumour growing in the animal was found to be about half of the dose required to destroy the viability of the same tumour *in vitro*.

337 Vitamin C and Capillary Fragility

L COTTI (*Polichinico Sez. Med.*, March 1, 1937, p 134) states that a deficiency of vitamin C causes a capillary fragility which is manifested not only in well marked scurvy but also in the so-called prescurvitic state or latent scurvy which is revealed by the ordinary tests for capillary resistance, such as the lace test and Hecht's cupping glass test. Dalldorf and Russell have recently found that patients with well marked capillary fragility show a rapid increase of capillary resistance as estimated by Hecht's test one to two hours after an intravenous injection of 50 to 100 mg of pure vitamin C. Similar results were obtained by Cotti both with Hecht's test and the lace test. As entirely identical results were obtained both in normal conditions and in the haemorrhagic diathesis, he concludes that vitamin C produces an increase of capillary resistance.

The "QUEEN CHARLOTTE'S" Portable GAS AND AIR MACHINE

The British Oxygen Company has produced a portable apparatus for gas and air administration intended mainly for use by midwives: its outstanding features are complete safety, low cost, portability, compactness, simplicity.

For midwives, general practitioners or dentists Model B (illustrated) is most suitable. In size and shape it is like an attaché case, convenient for carrying or strapping to a bicycle carrier, and its price without cylinder is £12 12 0. The working is simplicity itself and its general appearance inspires confidence in the user. An intelligent patient can safely administer the gas to herself for the quantity of gas inhaled is self-controlled by the patient's breathing. Model A is lighter and smaller. Model C is larger and has room for two cylinders. Prices respectively £11 11 0 and £13 2 6.

Model B as (illustrated) without cylinder £12 12 0

Spare parts and service from any B.O.C. Branch. Nitrous Oxide supplies delivered by motor in important towns.

A REALLY CONVENIENT DISTORTIONLESS DEAF AID

for Long Distance Hearing

Everyone who writes to me regarding Amplivox Deaf Aids whether they are themselves sufferers from deafness or medical men interested from the scientific view point, comments on the wonderful range and absence from distortion achieved by an instrument of such convenient size. It is rather remarkable that these little 2 and 3 valve amplifiers should have a frequency range of 50 to 6000 cycles per second and be equally suitable for all kinds of deafness but the accuracy of these facts is borne out by a wealth of authoritative testimony as you will discover if you will let me send you a copy of the Amplivox brochure. Incidentally I shall be pleased to let any of your patients have an instrument on a week's trial. No model costs more than 18 gns

WHEN SECONDS COUNT

—your gloves must be literally a part of your hands. They must respond to every delicate operative movement . . .

That's why more and more surgeons are insisting on Seamless Standard Latex Surgeons' Gloves. They have experienced the skin-freedom of these gloves, the firm grip. Slip on a pair, wet them and see for yourself the firmness with which you can grip slippery objects. Observe their uniform tissue-thinness, anatomical fit, their doubly reinforced wrist bands.

Though super thin, special processing has made them tough—for protection, longer life, and economy. Seamless Standard Surgeons' Gloves return from the autoclave time after time, alive and elastic. Money can buy no finer gloves. Made by the manufacturers of the famous *Macdonald* Surgeons' Gloves, unequalled at their price.

For Greater Comfort and Efficiency

CURTIS

ABDOMINAL SUPPORT NO. 1

For over twenty-five years the Curtis Abdominal Support No. 1 has been recognised by the medical profession as being more comfortable and efficient than any other support. There are over one hundred types of Curtis abdominal belts, corsets and supports, but none is so efficient as Model No. 1 Support. The big London Hospitals prescribe Curtis— with absolute confidence.

Specialists in Abdominal Appliances.

"... I saw it in the B.M.J."

—this is what we often hear when a practitioner, having searched his memory unsuccessfully applies to the Advertisement Department at B.M.A. House for information about some preparation or appliance which, casually noticed at the time, is now urgently required

Our records enable us to give the required particulars and, apart from the satisfaction of helping a reader, we feel glad that yet another advertiser has reason to know that advertisements in the *British Medical Journal* "live" for more than a week

In dealing with written enquiries, especially from overseas, we endeavour to put our correspondents into direct contact with the advertisers in whose products they are interested. By so doing time is saved and the utility of our Service is increased

Therefore—

in case of doubt or difficulty 'phone or write—

THE RESIDENTIAL TREATMENT OF ALCOHOLIC & DRUG ADDICTION

RENDLESHAM HALL

(Post Office Address) — WOODBRIDGE, SUFFOLK

Rendlesham Hall which is open to receive patients, is essentially a Sanatorium. Its daily life and routine are that of an ordinary comfortable holiday or health resort, or of a large country house. Each patient has all the privileges of a guest consistent with the prescribed medical treatment.

RENDLESHAM HALL, WOODBRIDGE, SUFFOLK

Rendlesham Hall has 45 bedrooms, and about 450 acres of gardens and park. It has also a private nine-hole golf course, tennis and croquet lawns, and bowling green.

Illustrated booklet giving particulars as to terms, etc., can be had on application to the

RESIDENT MEDICAL SUPERINTENDENT

Telegrams and Telephone: VICKHAM MARKET 16 (Toll Call from London)

Proprietors: The Norwood Sanatorium, Limited

RUTHIN CASTLE, NORTH WALES

The fees are from 15 guineas a week. They include medical attendance, all scientific investigations that may be needed, such as analyses, bacteriological cultures, the ordinary x-ray examinations, and electro-physiological studies. All the treatment that may be prescribed, such as special diets, insulin, artificial sunlight, electrical treatment, baths, massage, nursing, medicines or vaccines, board and lodging.

The only extra charge is that for a complete alimentary x-ray examination, or for x-ray therapy.

All the usual forms of treatment are given at Ruthin Castle. The climate is mild. The annual rainfall is 25 in. only, that is, less than the average for England. There is central heating throughout.

Address—THE SECRETARY, Ruthin Castle, North Wales.

Telegrams—Castle Ruthin. Telephone—Ruthin 66.

ST. ANDREW'S HOSPITAL

FOR MENTAL DISORDERS

NORTHAMPTON.

FOR THE UPPER AND MIDDLE CLASSES ONLY

President THE MOST HON THE MARQUESS OF EXETER CMG, ADC.

Medical Superintendent DANIEL I RAMBAUT M.A. M.D.

This registered Hospital is situated in 120 acres of park and pleasure grounds. Voluntary patients who are suffering from incipient mental disorders or who wish to prevent recurrent attacks of mental trouble, temporary patients and certified patients of both sexes are received for treatment. Careful clinical, biochemical, bacteriological and pathological examinations. Private rooms with special nurses, male or female in the Hospital or in one of the numerous villas in the grounds of the various branches can be provided.

WANTAGE HOUSE

This is a Reception Hospital in detached grounds with a separate entrance to which patients can be admitted. It is equipped with all the apparatus for the most modern treatment of Mental and Nervous Disorders. It contains special departments for hydrotherapy by various methods including Turkish and Russian baths, the prolonged immersion bath, Vichy Douche, Scotch Douche, Electrical bath, Plombières treatment, etc. There is an Operating Theatre, a Dental Surgery, an X-ray room, an Ultra Violet Apparatus, and a Department for Diathermy and High Frequency treatment. It also contains Laboratories for biochemical, bacteriological and pathological research.

MOULTON PARK

Two miles from the Main Hospital there are several branch establishments and villas situated in a park and farm of 650 acres. Milk, meat, fruit and vegetables are supplied to the Hospital from the farm, gardens and orchards of Moulton Park. Occupation Therapy is a feature of this branch and patients are given every facility for occupying themselves in farming, gardening and fruit growing.

BRYN-Y-NEUADD HALL

The seaside house of St. Andrew's Hospital is beautifully situated in a Park of 330 acres. Llanfairfechan amidst the finest scenery in North Wales. On the North-West side of the Estate, a mile of sea coast forms the boundary. Patients may visit this branch for a short seaside change or for longer periods. The Hospital has its own private bathing house on the seashore. There is trout fishing in the park.

At all the branches of the Hospital there are cricket grounds, football and hockey grounds, lawns, tennis courts (grass and hard courts), croquet grounds, golf courses, and bowling greens. Ladies and gentlemen have their own gardens and facilities are provided for handicrafts such as carpentry, etc.

For terms and further particulars apply to the Medical Superintendent (Telephone No. 2356 and 2357 Northampton) who can be seen in London by appointment.

NORTHUMBERLAND HOUSE,

GREEN LANES, FINSBURY PARK, N 4

The CLINIC

spent more than £7,000 on new additions and improvements in 1936

**NURSING AND CATERING SERVICES ENTIRELY RE-ORGANISED;
WIDE RENEWALS OF FURNITURE AND EQUIPMENT**

The Trustees of The Clinic have elected to extend a cordial invitation to medical Practitioners to visit the premises and inspect the various departments in equipment and service carried out during the past twelve months.

Over £7,000 has been expended on the building during the year that can be regarded as the surplus apart from ordinary maintenance expenditure in accordance with the provision of the present Corporation's Constitution.

Of special interest to all medical Practitioners is the extensive re-organisation of the Nursing Service to which a considerable expenditure has been devoted.

Amongst other new arrangements a free dispensary service will be available without any charge to the patients.

The invitation to the medical community to visit the premises is cordially extended.

The CLINIC 20, BELONSHIRE PLACE, LONDON, W.1.

POST-OPERATIVE CARE of Children

Children are usually affected severely by surgical treatment. Haemorrhage may have serious effects, blood regeneration may be slow. The child's continued growth, the body's effort to heal the wound and overcome infection, the limited capacity for nourishment, all call for the use of a "tonic."

During this period, Syrup Minadex supplies a tonic which may properly be called reconstructive. Designed specially for children, its components provide elements for maintaining neuro-muscular tone, for improving resistance to infections, and for promoting haemoglobin formation.

Syrup Minadex is an effective combination of minerals and vitamins, containing the therapeutic principles of two traditional tonics—Syr Ferri Phos Co and cod-liver oil—reinforced with activating substances. Its flavour is particularly appetising.

Syrup **MINADEX**
The Reconstructive Tonic

1937 Opinions of last Volume

One of the most useful handbooks on current therapeutics we know of. —BRIT. MED. JOURNAL.

To decide what book is most worthy to be called the general practitioner's bible might prove no easy task but the Medical Annual would certainly be in the short list. —LANCET.

No published book contains such a wealth of information which will be found of value to the general practitioner and the specialist alike. —MED. INDEX AND CUR.

Major's Physical Diagnosis

**JUST
ISSUED**

This is a book on the four cardinal methods of examination and their application in the diagnosis of disease. It was planned and written by Dr Major to meet specifically the needs of both medical student and practitioner. It takes up Inspection, Palpation, Percussion and Auscultation of the entire body from the head to the extremities. It is based on 15 years' experience in practising and teaching these methods. Dr Major shows you *how* to see, to feel and to hear those physical signs that indicate the presence of disease or abnormal conditions. He gives you the *meaning* of those signs, and emphasises the physical causes that are responsible for them.

Clearly stated—fully detailed

Dr Major's interesting style is evident throughout the book. He is clear in his statements and detailed in his directions. He contrasts the normal with the abnormal. He states plainly the pitfalls into which the physician may be led and tells how to avoid them.

An entire chapter is devoted to *Pain*—and in unusually fine chapter it is. Here he discusses both local and referred pain as it may exist in each part of the body, gives its general significance and the diseases and conditions which such pain may indicate. Another valuable chapter is that on *History-taking and Recording*. Here Dr Major tells exactly those things that you should elicit from the patient. He gives an 'outline' that will prove particularly helpful in questioning the patient and in providing a basis upon which to write the detailed history. When he quotes he quotes from *original sources*. The author does not take things for granted, either in giving the fundamental essentials or in applying them in the diagnosis of disease. He is explicit!

There are 427 illustrations, both photographs and drawings. These were chosen and included here to aid in a full comprehension of the significance of the methods and of the diagnostic findings discussed. Published as recently as February last, this book is already being strongly endorsed.

From the CHAPTER on PAIN

Projection of pain to abdomen in pneumonia

CONTENTS

Pain in each region of the body
General inspection
Examination of head and neck
Inspection, palpation and percussion of chest
Auscultation of lungs
Physical findings in diseases of lungs
Inspection, palpation and percussion of heart
Auscultation of heart

The pulse—its inequality and characteristics
Blood pressure—to-day's accepted methods
Physical findings in cardiovascular diseases
Abdomen and genitalia
The extremities
Examination of Nervous System
History-taking and recording

THE LANCET says

This valuable text book on physical diagnosis embodies fifteen years' experience in teaching by an enthusiastic first clinical medicine. Though the text is elementary it is essential for tea time at the bedside. It is written in a simple and practical style. The author is not only a first class clinician but also a first class writer. He makes use of all the resources of his own and recent work with frequent quotations and extensive lists of references. The many excellent photographs and diagrams are well chosen and the illustrations of Dr Major's enthusiasm are a great asset to the student and the teacher.

Order of 477 pages with 427 illustrations. By RALPH H. MAJOR, M.D.
Professor of Medicine in the University of Kansas. Cloth 21 net.

THE "DOCTORS' SHIRT" which has detachable sleeves!

Here is a most useful shirt which for many years we have supplied to the medical profession. With detachable sleeves just above the elbow, it fastens with four small buttons which are adjusted with a minimum of trouble. The 'Doctors' Shirt' possesses also these additional points of interest:

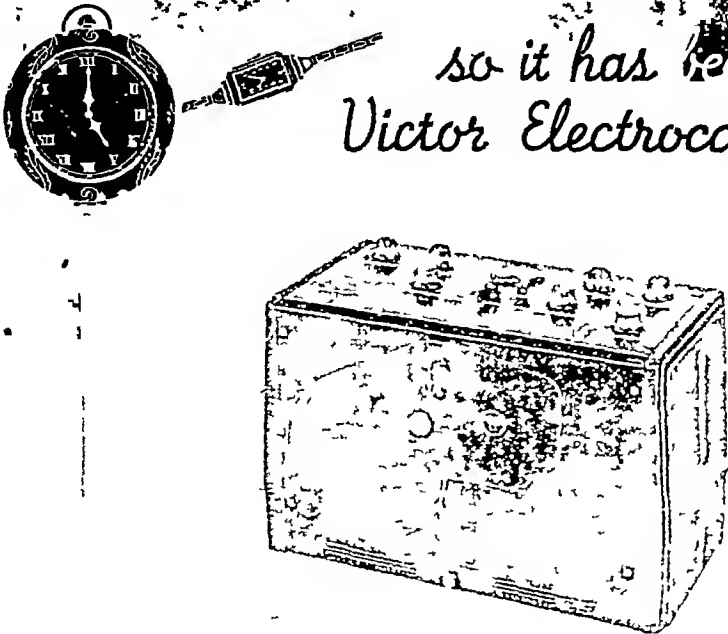

1. It keeps the cuffs smooth instead of being creased up by the process of rolling.
2. There is no fear of them coming down at an inopportune moment.
3. There is no muster of biceps to interfere with the action of the arm.

The 'Doctors' Shirt' is made in white poplin 10/6. Collars 1/- extra. Extra half sleeves sold separately. Also other fabrics striped or plain. For prices, patterns and sell measures send to Dept. B.M.J.

AS WITH ALL FINE INSTRUMENTS

so it has been with the
Victor Electrocardiograph

Making it smaller has made it more convenient without any sacrifice in accuracy or dependability

It is a *great* instrument, this new light weight low cost electrocardiograph, beautiful, too, in its streamlined, all metal, shielded case

Great, we say because while it is priced to be within the reach of most practitioners and institutions, it is *built to endure* to give the kind of service you have a right to expect to produce records—consistently—that are accurate and of true diagnostic value. No skimping in construction in order to whittle down manufacturing costs, no inferior component parts liable to cause embarrassing breakdowns. Instead, such care in building and choice of materials that dependable and economical operation is made inherent

The principle of thermionic amplification is retained—we introduced it in the field of electrocardiography and so far no better means of amplifying the minute current of the heart has been found. The new Victor Electrocardiograph incorporates its own power supply to make it independent of commercial electric current and to assure consistent smoothness of recording. Every modern refinement is included to make for simplicity of operation and accuracy of results

It is portable—but not at the expense of sturdiness. It is compact—but not at any sacrifice of proper internal construction. It is the famous Victor Electrocardiograph which you have admired and desired made smaller in size and lower in price

See it, inspect it inside and out, operate it. Make a test record to convince yourself that it is *fine* mechanically, electrically and clinically. To do these things in no way obligates you. Merely send the handy coupon—to day

SPENCER CORSETS ARE INDIVIDUALLY DESIGNED FOR THESE SIX CONDITIONS

HERNIA

For cases of inoperable hernia a Spencer provide support with real comfort and safety. A Spencer will control a reducible hernia and restore the patient to reasonably normal activity if operation is inadvisable.

**ENTEROPTOSIS and
INTESTINAL STASIS**

Where these conditions are known to exist and support is needed a Spencer Support is an accepted corrective measure. A Spencer supports the organs as nearly as possible in normal position and effects a marked posture improvement.

**SACRO ILIAC STRAIN and
LUMBO-SACRAL STRAIN**

Spencer Supports are designed to effect im mobilization of the involved joints and to improve posture. In many instances the conditions are immediately and successfully relieved.

MATERNITY

Spencer Maternity Support fit perfectly, provide gentle support and restful comfort. In many cases they relieve pain and backache when not pathological and lessen or control sacro iliac and lumbo-sacral strain.

MOVABLE KIDNEY

A Spencer Support for movable kidney is designed to support the abdomen from below upward and backward. It is also prescribed to elevate the kidney in cases of nephroptosis. A kidney pad is provided when prescribed by doctors.

POST-OPERATIVE

Many leading surgeons prescribe either the Spencer Abdominal Supporting Belt or Supporting Corset for post-operative convalescence as a precaution against accident or injury.

Because each Spencer is individually designed and made from the actual measurements and posture description of the patient, exact fit and restful comfort are assured and the garment will not ride up or slip out of place.

All Spencers are designed to improve posture, provide abdominal uplift and to place the pull on the pelvic girdle, not on the spine at or above the lumbar region. They unite accepted surgical features and fine style lines.

Spencers improve appearance, are light in weight, flexible, easily laundered and are guaranteed NEVER to lose their shape.

Trained Spencer Corsetters are resident throughout the Kingdom. Name of nearest gladly supplied on request. A scientifically trained Spencer Corsetière will call at your surgery or at your patient's home to take measurements under your supervision. Spencer Supports and Corsets are never sold in shops.

FOUNDATION GARMENTS AND SURGICAL SUPPORTS
PATENTED

We create a design especially for you.

Beware of Substitution.—Spencer Corset Ltd. regret the necessity of warning the medical profession that in several instances where doctors have prescribed a Spencer Support, a corset of another make has been substituted and, because it makes no sense to understand the Spencer principles of individual designing, has been unsatisfactory. Every genuine Spencer Support bears the SPENCER Label.

Scalp injuries

Elastoplast has proved itself of great value in dealing with scalp injuries. By using a short length of three-inch Elastoplast Bandage, tailed at each end to accommodate the ears, it is possible to keep a dressing firmly in position without discomfort. This type of dressing retains the pad in position where other bandages would

quickly become displaced during sleep. The ease with which Elastoplast may be moulded to any part, and also the speed with which it can be applied, renders this occlusive dressing particularly valuable in first-aid work. For parts difficult to dress, Elastoplast simplifies both application and examination.

A copy of "Elastoplast Technique" will be sent on request.

'CELLANBAND'

ANTISEPTIC PASTE IMPREGNATED
BANDAGES

The CELLANBAND Dressing when properly applied furnishes a mechanical support vastly superior to crepe or rubber bandages elastic hosiery etc. and will usually be found sufficiently robust to enable the convalescent to resume reasonable light duties at an earlier period. CELLANBAND Dressings exercise a marked dehydrating and antiphlogistic effect resulting in rapid reduction of oedema. Air access to the tissues is not interfered with as in the case of gelatine dressings so that evaporation of the skin secretions continues normally.

12/- PER DOZ. (7 yds long 4 in wide)

'SANOID'

STERILIZED LIGATURES

These ligatures are British both in production and materials. Their Tensile strength is well in excess of the recognised standards for particular sizes. A special process gives a surface finish that ensures easy manipulation. SANOID Ligatures are exceedingly supple the catgut straightens out and remains straight without 'kinks' which are liable to cause breakage. Sterilization is carried out by the most up-to-date methods and independent bacteriological tests over several months in all cases gave negative results. Exceptional elasticity lessens the risk of necrosis.

INFRA-RED RADIATION IN GENERAL PRACTICE

The "Duplex" Apparatus

The present wide spread interest and use by the medical profession of this method of treatment is undoubtedly due to the remarkable results attending its application primarily in RHEUMATIC AND ALLIED DISORDERS FIBROSITIS SCIATICA LUMBAGO NEURITIS SPRAINS BOILS AND CARBUNCLES PYLOROSPASM ETC IN SO FAR AS RHEUMATIC AND ALLIED DISORDERS ARE CONCERNED THE EXTRAORDINARY RELIEF OF PAIN BY HEAT RAYS IS ABUNDANTLY CONFIRMED IN THE COMPREHENSIVE SURVEY INDICATED IN THE REPORT OF THE B.M.A. COMMITTEE ON THE CAUSATION AND TREATMENT OF ARTHRITIS AND ALLIED CONDITIONS (see B.M.J., June 17th, 1933)

There is nothing new in the application of infra red radiation. It is but the logical sequence of the epoch-making discovery of Prof Finson in 1883. The apparatus here described is the product of research for a simple yet highly efficient apparatus for the convenient application of this form of radiation devoid of unnecessary elaboration perfectly safe in use and at a very moderate cost. It is supplied in two models one with fixed base and the other with collapsible base for visiting cases. A long wave infra red non luminous generator with an interchangeable luminous heat bulb is provided. Price complete for either model is 95'6

We have 25 years' experience in the manufacture of equipment for Physical Medicine for the profession

FOR EFFECTIVE CONTROL OF PAIN

AMONG the many and diverse analgesics which have been evolved by modern chemical research acetyl-salicylic acid retains its reputation as one of the safest and most effective. Its tendency to liberate salicylic acid—the irritant properties of which are well known to physicians—has however caused many to hesitate to employ it as widely as it deserves. Exhaustive trial in hospital and private practice proves that Alasil definitely solves the problem of administering acetyl-salicylic acid in an effective form being free from the risk of irritating the stomach or bowels or of causing general reactions.

*A supply for clinical trial with
full descriptive literature sent
free on request*

In Alasil the desirable therapeutic effects of acetyl-salicylic acid are well exhibited by its calcium acetyl-salicylate moiety while the presence of "Alcol" (Colloidal Hydroxide of Aluminium) a powerful gastric sedative and antacid obviates any tendency to gastric irritation. The superior absorbability of Alasil over ordinary salicylate compounds and its freedom from the risk of liberating free salicylic acid in the stomach have been well proved by careful experimentation. Alasil can be prescribed with perfect safety to patients of all ages and in larger doses than ordinary salicylate compounds.

The importance of The Qualitative Adequacy of the Diet

"If the diet is unsuitable the body cannot be properly constructed neither can it function effectively"

(Ministry of Health First Report of Advisory Committee on Nutrition 1937 p 6)

The report quoted above stresses the need for ensuring that the whole community is provided with food which is qualitatively adequate. And it is acknowledged that foodstuffs containing vitamins play an important role in the economy of the body. Marmite is a yeast extract

that is exceptionally rich in vitamin B₁ and the B₂ complex. It is prescribed extensively for its positive health promoting properties. Marmite has many uses in preventive and curative medicine and there is ample evidence of the benefit accruing from its regular inclusion in the diet.

WHOOPING COUGH

Detoxicated Whooping Cough Vaccine (Genatosan) has proved remarkably successful. Reports received from medical practitioners state that it usually reduces the frequency of the paroxysms after the first injection, and subsequent injections almost invariably clear up the condition. Owing to the elimination of the toxic elements of the germ during the process of manufacture, this vaccine may be given to infants and young children, in doses sufficiently large to produce the desired therapeutic effect, with an absence of harmful reaction.

The following is typical of many reports received from physicians —

"I have been making a somewhat extensive use of your Detoxicated Vaccine for Whooping Cough, and am pleased to say that the results have been almost invariably gratifying. In nearly all my cases the very distressing symptoms have disappeared after the third injection." — M D

Additional information regarding this Vaccine will gladly be supplied on request

MAT WEAVERS.—In the sleepy little villages of Keen and Napoopoo, on the Island of Hawaii, one can see the native women at their mat weaving. These are seated under a luhala tree from whose leaves the mats are woven. To-day there is a revival of this old art and many beautiful modern articles are being made.

P.S. If you will write us on your letterhead we shall be glad to send you a free sample tin of Dole Hawaiian Pineapple Juice.

SULPHONAMIDE-P B.D.H.

(para amino ben-zene sulphonamide)

*For oral administration
in hæmolytic streptococcal infections*

The widespread use of Sulphonamide-P B D H (p-aminobenzenesulphonamide) in the ordinary routine of clinical practice has served to demonstrate that this substance possesses remarkable bacteriostatic and bactericidal activity against hæmolytic streptococci even when it is administered orally.

It is employed in the treatment of puerperal septicaemia and erysipelas and in other conditions due to infections of hæmolytic streptococci such as scarlet fever, tonsillitis etc. It has also a wide prophylactic use. Sulphonamide-P B D H is issued in tablets each containing 0.5 gramme of the pure substance.

ACRIFLAVINE 'B.D.'

Acridine 'B.D.' is invaluable as a dressing for wounds, for ulcers of the leg, carbuncles, cellulitis, osteomyelitis, acute suppuration, abscesses, septic hands and anal fistulae, also as a lavage in the treatment of gonorrhoea. Further, it is prescribed as a routine in such conditions as influenzal pneumonia, meningitis, impetigo,

psoriasis vulgaris, typhoid fever and undulant fever.

In surgery also Acridine 'B.D.' is of inestimable value in ophthalmic work and generally (in the form of an emulsion) for application to post-operative wounds, grazed surfaces and similar abrasions.

A sample of any of the preparations of Acridine 'B.D.' will be sent on request

THE TREATMENT OF HAYFEVER

POLLACCINE, the vaccine prepared in the Inoculation Department of St Mary's Hospital, London, from the pollen of Timothy Grass, is useful not only for prophylactic purposes but also for the relief of symptoms in hayfever patients who have not received prophylactic doses during the Spring, or who have not been sufficiently desensitized. It must be borne in mind that during the hayfever season the patient is already receiving air-borne pollen and, consequently, only a small dose of the vaccine can be tolerated.

For symptomatic relief two preparations which may be applied to the nasal mucosa are Anesthone Cream and Adrephine Inhalant —

ANESTHONE CREAM contains benzocaine, Adrenalin Chloride and ephedrine hydrochloride in a base of lanolin and petrolatum, a small quantity may be applied to the nasal mucosa and the conjunctiva every two or three hours, if necessary.

ADREPHINE INHALANT contains these three ingredients in a fluid medium suitable for application as a nebula from a "Glaseptic" Nebuliser.

Full details of the foregoing preparations will be furnished on request

TWICE THE VITAMIN A POTENCY OF MILK

Why Cadburys Milk Chocolate is the ideal between-meal snack

IN THE LONG INTERVALS between the main conventional meals efficiency has been proved to flag and the nervous system to undergo strain. An 'extra meal'—a between-meal snack of real food value but preferably of slight bulk—averts this condition. To 'Eat More Often' without, however, increasing the total food-intake, is markedly beneficial in every normal case.

For this purpose the value of milk is well known, but especially in cases where the conditions of work render the consumption of milk difficult. Cadburys Milk Chocolate will be found of even greater value. Handy and portable from the worker's point of view, it is highly nutritious and energising.

Recent tests made by the highest independent authority on

samples of Cadburys Milk Chocolate taken from current production indicate that the chocolate contains 6 International Units of Vitamin A per gram as compared with a stated potency for milk of 3 International Units per gram.

It will thus be seen that the 'concentration' of the milk incidental to its conversion into Cadburys Milk Chocolate is far from affecting its original qualities.

*1½ glasses of full cream milk contained
in every ½ lb block*

ANAHÆMIN B.D.H.

In the treatment of pernicious anæmia

The introduction of anahæmin—the active hæmatopoietic principle of liver—wrought a revolution in the treatment of pernicious anæmia, and experience in important hospitals and in the ordinary routine of clinical practice continues to confirm on every hand the outstanding efficacy of this form of treatment of pernicious anæmia. Already there is ample clinical evidence of the fact that average cases respond to an initial injection of 2 c.c., followed by 1 c.c. injections at 10-day intervals until the blood count has remained normal for a month, and that for the maintenance of the patient in a condition of robust health a monthly injection of 2 c.c. is usually sufficient in most cases.

Furthermore, not only is anahæmin remarkably effective, but the cost of anahæmin therapy is exceptionally low, for example,

inasmuch as six injections usually suffice to re-establish a normal blood count within six to eight weeks, the total cost to the physician in such cases amounts to 25/- or even less.

STABILISED — SOLUBLE — NEUTRAL

CHOREA

From information received —

I have used Calcium Aspirin (Genasprin Brand) in a male aged 8 years in a mild but intractable case of chorea (Sydenham's) hitherto of 8 weeks previous history and no improvement with arsenic chlorotone or sod. sal. I gave the patient 71 tablets twice daily in divided doses actually 4 doses each day following food for one month. The case completely recovered after one month on Calcium Aspirin.

When I heard of the Calcium Aspirin my case a female aged 13 years had been in bed six weeks with severe chorea and was then showing definite signs of improvement. After one week's treatment with Calcium Aspirin 15 grs t.d.s. improvement was very rapid and the exhibition of Calcium Aspirin was stopped and now the patient seems quite well.

I have had excellent results with Stabilised Calcium Aspirin in severe cases of chorea in several adolescent males and females ages varying from 10 to 15 years. I gave the patients from 5 to 15 grs three times a day over a period of three to six weeks. The twitching movements were controlled early and there was no evidence of over-dosage with salicylates. In addition most of the children have found this preparation to be extremely palatable.

I gave Calcium Aspirin 15 grs t.d.s. to a female patient aged 28 years who was suffering from chorea, and have never seen a case of this kind make such rapid improvement.

I have found Calcium Aspirin excellent in all my cases of chorea.

TRANSURETHRAL RESECTION OF THE PROSTATE A REVIEW OF FOURTEEN YEARS' WORK*

BY

KENNETH M WALKER, F R C S

Surgeon to the Royal Northern Hospital and to St Paul's Hospital

Twelve years have elapsed since I first published in this *Journal* an article on perurethral operations on the prostate. At that time it was necessary to plead that consideration should be given to a method of treatment against which there existed a considerable amount of prejudice. Special pleading is no longer required, for the value of perurethral methods of dealing with prostatic obstruction is now fully recognized. It will be more useful, therefore, to consider perurethral resection in a spirit of criticism and to dwell on its shortcomings, dangers, and limitations rather than its virtues. But if I approach the matter from this standpoint it is not because I am anything but an optimist on the subject of perurethral methods but because I feel that it is helpful at times to stand aside from our work and to look at it with a critical eye recalling where we have failed rather than where we have succeeded what have been our mistakes, and how we may avoid such errors in the future.

Undoubtedly the two complications of perurethral resection most to be feared are haemorrhage and sepsis. Of these, to my way of thinking the latter is by far the more serious. Looking back on fourteen years of perurethral operations on the prostate I can recall only some half-dozen cases in which haemorrhage became sufficiently alarming to necessitate opening of the bladder. Yet in the same period of time sepsis has often proved a serious complication and sometimes one that in the end proved fatal. What is the explanation of my immunity from haemorrhage and my susceptibility to sepsis? Writing as I do in a vein of criticism and relentless examination of methods, I think that if I have made an error—it has lain in the direction of excessive tissue coagulation. J R Caulk to whose pioneer work on perurethral methods urology owes so much is convinced that high frequency currents cause damage to tissues at a far greater distance from the cutting loop than most resectionists believe. I am inclined to agree with him and it is this leaving behind of coagulated tissue as a nidus for infecting organisms that is the chief drawback of the McCarthy operation. Unfortunately it is a drawback inherent in any method of resection in which a cutting current is employed.

Operative Trauma

But in addition to the unavoidable trauma of electrocoagulation there is a trauma over which we have more control—the trauma of instrumentation. When I pause and look back at my failures I see that there is one type of case in which perurethral resection is attended by special dangers. I refer to the patient with small external genitalia and with a urethra so narrow that it offers a considerable resistance to the passage of the resectotome. Naturally these cases crop up most frequently among those elderly patients in whom involution of the genital tract has taken place, the type of senile patient for whom a perurethral operation is otherwise most suitable. At all costs we wish to avoid carrying out on them a

prostatectomy, and yet the smallness of the urethra makes difficult the passage of our instruments. The temptation to use a little extra persuasion is a real one, but I have learned my lesson and am now very cautious about the amount of force I am prepared to exert in attempting to pass the

resectotome. Where I have not shown this caution the results have sometimes been disastrous—in one case extravasation of urine, and in two others severe urethral and vesical sepsis. It must be remembered that the tissues of these elderly patients are exceedingly vulnerable, and even in health offer but a feeble resistance to microbial invasion. After they have been bruised by the passage of an instrument the resistance is reduced to a minimum.

Finally we must consider the trauma due to errors in our technique after the instrument has been passed. Errors of this kind are by no means uncommon, for in no operation is the experience of the operator a factor of greater importance than in perurethral resection of the prostate. Initially welcomed as a minor procedure, the McCarthy operation in the hands of the inexperienced soon proved itself to be fraught with dangers and even when carried out by experts the earlier resections were not always satisfactory. The better results achieved later have indeed been due less to an improvement in our instruments than to more control during the operation. With the cutting loop it is quite easy to do great damage and it is experience that teaches the operator where he may cut in safety and where he must proceed with caution. The figure above represents a vertical section

* Opening Address at the annual general meeting of the Section of Urology Royal Society of Medicine April 22 1937

through the mid line of the bladder and prostate, and shows approximately the thickness of tissues that separate the bladder and posterior urethra from such structures as the peritoneum and rectum. Starting at a point in the bladder above the inter-ureteric bar it will be seen that a single cut at this level would perforate the bladder wall and open up the peritoneum. Fortunately few operators would be capable of making such a mistake. The error of mistaking a hypertrophied inter-ureteric bar for the posterior lip of the vesical outlet is however less unlikely. Should this happen but the misguided operator cut not more than half an inch above the inter-ureteric bar he will miss the peritoneum and open up the space of Denonvillier. At this level the vesicles and ampullae of the vasa are interposed between the bladder and rectum so that the latter is well protected from possible injury. But to open up the space of Denonvillier is sufficiently disastrous for it will result in prolonged and severe infection. The same risk is attached to any cut made in the trigone from the inter-ureteric bar down to the region of the intravesical projection of the prostate. At this lower level the thickness of the prostate is interposed between the loop and the rectum and even without any enlargement gives the operator the safety of an inch. As we pass down into the posterior urethra this margin of safety diminishes rapidly so that at the upper limit of the verumontanum less than half an inch of tissue separates the urethra from the rectum. Lower still in the membranous urethra even this distance is diminished.

Danger Points

From a consideration of these anatomical details it will be seen therefore that there are two chief danger points in carrying out a prostatic resection: (1) the region of the trigone; (2) the posterior urethra. An injudicious cut in the first region will open up the space of Denonvillier and in the second perforate the rectum. Of these two disasters I fear the former more. Two of my patients have passed urine per rectum a few days after resection without being any the worse for their temporary fistula. Some twenty have suffered from severe sepsis following a resection and although I have no definite proof of this I believe that in some of these cases of protracted sepsis the space of Denonvillier has been infected. In order to prevent this when removing tissue at the level of the sphincter the instrument should be kept horizontal and not dipped down into the bladder.

It may be thought that I am over-emphasizing the factor of sepsis in the McCarthy operation. If this be so it is because it has proved to be the chief trouble that I have encountered in my own practice. Some of this sepsis as we have seen is avoidable but some is inherent in the operation. So long as the actual removal of prostatic tissue is accomplished by a diathermy cutting current so long must we leave behind tissue that will form a nidus for infection. That I am not alone in fearing this defect in what is otherwise an excellent operation is shown by a reference to current urological literature. Everywhere we see an increasing realization of the risks of extensive tissue damage and a forsaking of electrical methods of resection in favour of the cold punch of Young. For what is the Bumpus resectome except a Young punch to which has been added a diathermy electrode, an irrigation system and an internal source of illumination? Unfortunately I have not yet had an opportunity of using the Mayo Clinic and of seeing Mr. Thompson at work with his latest pattern of punch. I have however had the pleasure of watching Mr. F. H. O. B. K. Brown use the same technique as S.

Thomas's Hospital and have been very favourably impressed by the ease and rapidity with which he removed a large amount of prostatic tissue. More particularly have I been struck by the moderate amount of haemorrhage that has been provoked by the cold punch and by the ease with which it was subsequently controlled by the use of a coagulating electrode. Certainly in the hands of an expert accustomed to the use of a direct vision cystoscope the Thomson punch is an excellent instrument. The ease of its introduction and the avoidance of coagulation except for the control of isolated bleeding points contribute to render it a less traumatic weapon than is the McCarthy resectotome. Its chief disadvantage to my way of thinking is that it makes use of an optical system to which few of us are accustomed. This is however a deficiency to be overcome in us rather than in our instrument and while learning a new technique we may take comfort in this thought. The punch is a much less dangerous weapon than the loop with a punch it would be difficult to perforate the bladder with a loop it is quite easy to do so.

That the realization of the disadvantages of using the cutting current in prostatic surgery is widespread is also shown by the fact that J. F. McCarthy the inventor of the resectotome most widely employed in this country has recently designed a new instrument on the lines of the Young punch. He has referred to it as supplementary to his other instrument, but that the chief exponent of a cutting current method of resection has moved in the direction of the cold knife is highly significant.

Treatment

So far I have spoken only of the factors that determine the onset of sepsis. It will now be necessary to discuss methods of treatment once it has occurred. In this connection bladder drainage and lavage are of primary importance. This is easily carried out by the indwelling catheter. Where however a severe infection has existed prior to operation where the urethra tolerates badly an indwelling catheter or where the patient is likely to resent catheterization I am more and more inclined to combine resection with a temporary suprapubic drainage. Not only does this allow of the adoption of far more efficient methods of treatment of sepsis but it relieves us of all fear of clot retention following the operation. Moreover these gains are purchased at a very small cost for once the obstruction has been removed the suprapubic fistula will close up in the course of a few days.

Another addition to the technique of the McCarthy operation which I invariably make is vasoligature. An acute epididymitis is a distressing complication but one that is not usually considered serious. Yet I can recall one patient on whom I omitted to carry out vasoligature on the grounds that he was so poor an operative risk that the less that was done to him the better. In spite of severe attacks of angina pectoris he survived my resection but died four weeks later from a suppurative epididymitis.

Indications for Perurethral Resection

A critical survey of perurethral resection of the prostate may well conclude with a discussion of its indications. For what type of case and in what circumstances should resection be substituted for prostatectomy? There are questions to which many answers have been given. How widely these answers vary is shown by a comparison of statistics obtained from six different American urological centres. I quote American statistics because figures available for perurethral resection are much fewer.

than those obtainable in this country. Dr L. M. Orr, in the *Journal of Urology*, states that in six different American clinics the number of resections performed to one prostatectomy was as follows: 80, 19, 9, 17, 15, 0.9 respectively. To his question, "On what type of case do you employ resection?" circularized American surgeons returned answers that ranged from a frank denial that it was of any value to an assertion that it should be employed in every type of case. In England, perhaps owing to our happy genius for discovering middle courses, these extremes of opinion are seldom encountered. The majority of urologists have accepted perurethral resection as a valuable addition to our methods of treating the obstructing prostate and use it in moderation. Each of us may differ in our interpretation of the word moderation but our divergence is not great. Personally I mean by that word that I employ resection in about 20 per cent of all my prostatic cases, reserving it in particular for minor enlargements or for patients in whom, for one reason or another, it would be dangerous to perform a prostatectomy. Because resection can be carried out in cases in which enucleation would be dangerous it appears to me to be the most valuable of recent additions to our methods of treatment. When combined with a temporary suprapubic cystostomy done under local anaesthesia it is by far the safest of all the surgical attacks on the obstructing prostate, and can be carried out on patients who formerly would have been condemned to catheter life or to a permanent suprapubic drainage. It provides therefore, a welcome way out of many a difficult clinical problem.

In conclusion I should like to make a digression. For a long time I have felt that our methods of dealing with prostatic obstruction were in some danger of becoming over-standardized. There is a tendency for us to become champions of one or another particular brand of operation instead of exponents of them all. Personally I am trying to avoid being pro McCarthy, pro-Thomson, pro-Harris, pro Freyer, or pro Thomson-Walker, and employ each method where I believe it to be indicated. Each of these techniques has its place in our surgery, each its advantages and its shortcomings. In the preceding retrospect I have pointed out what in my opinion are the chief disadvantages of the McCarthy operation and have discussed some of the steps that urologists are now taking to remove them.

C. Weysser (*Dtsch. med. Wschr.* February 19, 1937, p. 307) remarks that some sixty different causes of abortion have been identified but that it is very difficult to associate any one of them with a given case. The treatment of threatened abortion has till recently lacked specific direction but now with the recognition of the part played by vitamins and hormones in this matter, it is possible to be more rational and less empirical. The author gives an account of his experience with ninety-six cases of threatened abortion treated with the vitamin D preparation *vigantol*. His rationale was based on the investigations of Poullson who in 1924 drew attention to the favourable effect of cod liver oil on intra uterine development. The *vigantol* was administered three times a day, only one drop at a time. This treatment was continued for several weeks and when possible to term. Other and older remedies for threatened abortion such as opium and rest in bed for at least a week after the cessation of haemorrhage were not neglected. This treatment was successful in about half the cases. The author chooses as controls the records of other gynaecologists whose patients were not treated with vitamin D and whose results varied considerably but were always much inferior to those claimed for vitamin D medication.

BLOOD TRANSFUSION IN OBSTETRICS

BY

MALCOLM D. BLACK, M.B., Ch.B.,
F.R.F.P.S., M.C.O.G.

Lately Registrar to the Glasgow Royal Maternity and Women's Hospital

This article has been written to describe the formation of a blood transfusion service and to give an outline of the indications, method, and dangers of blood transfusion. Among the branches of medicine in which there is a place for blood transfusion obstetrics is pre-eminent, yet this fact has been neglected for many years on the ground that the pregnant or parturient woman stands blood loss better than any other type of patient.

As pointed out by Professor Dugald Baird in a lecture to the Glasgow Obstetrical Society and later published in the *Lancet* (1936), one of the outstanding needs of an efficient maternity hospital is a blood transfusion service. The great difficulty found by most institutions requiring large numbers of transfusions has been to secure a suitable donor promptly. In previous years patients have died after a stay of eight hours in this hospital, during which time twelve donors had been tested and found unsuitable. It is thus desirable to have a list of grouped donors within easy call.

Procedure in the Glasgow Royal Maternity and Women's Hospital

In June, 1936, a service was started in this hospital. Placards had been posted at the entrance to it and in public places in the neighbourhood stating that male donors were urgently required, and that a fee of £1 1s would be paid to anyone giving blood. The prospective donors were asked to leave their names at the inquiry office. At a later date they were requested by postcard to come to the hospital for examination of the heart and lungs, Wassermann reaction, and blood group. If the heart and lungs were normal and the Wassermann reaction was negative the donor was placed on the roll and informed to that effect by another postcard. By this means a roll of 180 donors has gradually been built up. All groups are put on the roll.

Before a donor is sent for the recipient's blood is first grouped to determine the appropriate donor. The policy of the hospital, notwithstanding, is still to use a relative where possible. By this means a saving of universal donors is effected. However, in cases of great urgency a Group IV donor is summoned at the time of the patient's admission. When the occasion arises the motor hirers to the hospital are telephoned given the names and addresses of three donors living in the same locality, and instructed to secure one donor as quickly as possible. In this way a donor can practically always be secured within thirty minutes.

When a donor arrives a rapid direct compatibility test is performed before the transfusion is started. The blood having been withdrawn the donor is kept lying flat for about one hour, given a hot meal and then sent home by taxi. He also receives a form stating that he has given blood, and on production of this form at the house superintendent's office he is paid the fee of £1 1s. Should a donor be called and not used he is paid 5s. This service has been made available for the private practice of the members of the visiting staff of the hospital. Since the commencement of the service fifty donors have given blood and nineteen have been called and not used. By means of this service we hope to prevent as far as possible deaths from haemorrhage in the hospital.

Methods

The test for compatibility is made either by naked-eye examination of a mixture of the donor's corpuscles with the recipient's serum one drop of blood being added to two drops of serum or by making a hanging-drop preparation of equal parts of a fine suspension of the donor's corpuscles one drop of blood in 1 ccm of a 5 per cent citrate solution and the serum of the recipient. Agglutination will take place in five minutes if the bloods are incompatible. The test for agglutination makes unnecessary that for hæmolytic since agglutination always occurs before hæmolytic. In transfusions performed outside the hospital a compatibility test can be performed after waiting about ten minutes for a little serum to separate off from the recipient's blood.

It may be noted here that in certain cases corpuscles from a universal donor from a donor belonging to the same group as the patient or from the patient herself have appeared on a cold slide to be incompatible with the recipient's serum. On warming the slide however the agglutination which has never been absolutely definite disappears. In all cases wherever possible two persons should make independent tests for compatibility.

In this hospital the indirect method of transfusion is always used. The blood is drawn off from the donor in a separate room by means of a French's venesection needle to which is attached a few inches of rubber tubing. The blood is allowed to run into a flask containing 150 ccm of a 5 per cent citrate solution. While the blood is being run into the solution a gentle rotatory movement is maintained to secure proper mixing in the flask. Thus 600 ccm of blood are drawn off so that the flask contains 750 ccm fluid—namely 600 ccm of blood and 150 ccm of 5 per cent citrate solution which gives a final 1 per cent citrate mixture.

Instead of the ordinary tourniquet being applied to the donor's arm the arm piece of a Biomanometer is used. By this method the constricting pressure can be maintained at about 60 mm Hg a figure well below the systolic blood pressure. It is not uncommon to find even in healthy young adults a sudden fall in blood pressure probably of psychic origin soon after the onset of the proceedings. Cutting down on to a donor's vein should never be permitted. It may be noted that the London blood transfusion service has wisely instructed their donors never to allow a surgeon to cut down on to the vein.

After the blood has been secured a simple gravity saline infusion apparatus is used. Cutting down on to the recipient's vein is always advisable as it is surer and quicker in collapsed patients. The vein is first ligatured distally and a single loose knot is tied round the proximal end. The opening in the vein is best made transversely by a pair of sharp scissors and the cannula is inserted some saline being kept running through it during the process. When the cannula has been inserted the knot of the proximal ligature is drawn tight. If difficulty occurs in inserting the cannula the proximal flap of the incision in the vein may be lifted up with fine non-toxic dressing forceps. This method is in our experience the simplest and quickest.

The Kump on Brown method with the flask and bellows has been discarded in this hospital on account of the difficulty in inserting the cannula into the vein and the liability of the cannula to slip out when the patient is restless. The usual amount given is 600 to 1000 ccm. An exception to the gravity method has been made on one occasion the French's venesection needle being used.

In our experience no clotting or other difficulty has been found. Twenty minutes at least should be taken in introducing 600 ccm of blood otherwise an acute dilatation of the right side of the heart may be encountered. In cases of urgency while the operator is securing blood the assistant can cut down upon the recipient's vein and so expedite the transfusion.

In very collapsed patients, such as cases of retained placenta with severe post partum hæmorrhage, it is occasionally almost impossible to keep the patient at rest while inserting a cannula or starting the blood transfusion. In these cases in our experience the best line of treatment is to give the patient a few drops of ether on an open mask. The patient becomes anaesthetized quickly and then lies at rest coincidentally the general condition is much improved owing to the stimulant action of the ether. This procedure has been found to be much safer than an attempt to give a blood transfusion to a struggling patient who has to be forcibly controlled especially since this state of restlessness is often a sign of impending death.

Athrombit Method

This non citrate method has only been used on six occasions in this hospital. It is useful in cases of small blood transfusions such as 300 ccm given to increase the patient's resistance, but it has been found unsuitable for the large transfusions to replace blood loss which are so often required in obstetrics.

Transfusion Outside the Hospital

In cases of extreme urgency it is often preferable to treat the patient by blood transfusion in his own home before transit to hospital. In these cases and in private practice generally the gravity method can be easily performed in the patient's home. It is better to draw off the blood in the hospital and carry it out to the patient but in the case of patients living at a great distance from the hospital or in private practice, the whole procedure may take place in the home.

Indications

The following table shows the various conditions treated by blood transfusion in the years 1935 and 1936 in the Glasgow Royal Maternity and Women's Hospital.

	Retained Placenta & P.P.H.	Placenta Prævia	Accidental Hæmorrhage	Abortion	Obstetric Shock and Others	Total Cases	Total Transfusion
1935	27	19	16	22	8	92	105
1936	49	30	14	29	22	145	165

The main object in obstetrics in giving blood transfusion has been to replace blood loss from hæmorrhage. At times it has been given with a view to increasing the patient's resistance to infection.

Very Collapsed Patients

The question often arises whether it is too late to give a transfusion while the patient is living. It is not too late. To illustrate this point a case may be quoted of retained placenta and post partum hæmorrhage in which just as the blood had been drawn off the patient stopped breathing. The pulse could not be felt and the patient was apparently dead. In rapid succession adrenaline injection, the administration of oxygen and artificial respiration were started at once and the blood transfusion was com-

tinued. At the end of the first 900 ccm the patient was breathing the pulse was just perceptible but she was still unconscious. Since another donor was available more blood was secured, by the time 1,800 ccm had been given the patient was wide awake and conversing freely.

The question of giving intravenous saline solution to a patient requiring blood transfusion while waiting to secure blood requires discussion. If blood is not yet available and the patient is not at the point of death an intravenous saline injection should not be given, otherwise the blood pressure will be raised, the haemorrhage will recur and she will soon be in a worse state than before. On the other hand, if blood will be available within half an hour to one hour, or if the patient be at the point of death, it is better to start giving an intravenous saline injection and to continue it until blood has been secured.

Retained Placenta with Post-partum Haemorrhage

It will be seen from the table that most cases requiring transfusion belong to this class. When the patient has received a transfusion the placenta must be removed by expression or manually otherwise further bleeding will occur coincident with the rise of blood pressure. It is sometimes held that if the patient had previously been in a very collapsed state she should be left for some hours after transfusion before any operative procedure is undertaken. The delay often results in more bleeding however. Many patients will lose nearly as much blood as they have been given and require a further transfusion before operation.

If the patient at the end of the transfusion is still too weak to stand operative intervention more blood must be transfused till the patient is fit, at which time the operation should be undertaken. In some cases in the past when transfusion had been unsuccessful the amount of blood given was insufficient. Hence large quantities of blood are essential, at times up to 2,000 ccm.

Placenta Praevia

Cases of placenta praevia very often require transfusion before operative procedures can be undertaken. Since these patients may lose a great deal of blood during the operation, preparation should be made to give a further transfusion in the course of it or immediately afterwards. As in cases of retained placenta all operative procedures should be undertaken soon after the first transfusion. A very important factor in the fall in the maternal mortality from placenta praevia in the past few years has been the increased use of blood transfusion as an adjunct to operative treatment.

Accidental Haemorrhage

While very few people doubt the efficacy of blood transfusion in cases of placenta praevia many hesitate to recommend it for cases of accidental haemorrhage. Examination of the mortality in cases of accidental haemorrhage reveals that blood loss is often an important factor. Transfusion is thus indicated in these cases. However since there is often such a large element of shock independently of the actual blood loss and especially in the form of accidental haemorrhage associated with utero-placental apoplexy the results cannot be expected to be so good as in cases of placenta praevia and post partum haemorrhage. Similarly, in cases of obstetric shock with no apparent bleeding it is difficult to know if blood transfusion is advisable theoretically.

intravenous saline solution should be sufficient. In practice relatively few cases of obstetric shock occur apart from associated blood loss hence transfusion is usually indicated.

Incomplete Abortion

Many cases of abortion are admitted after great blood loss outside the hospital. The patients are still bleeding and show every likelihood of continuing to do so until the uterus has been emptied. In these cases a blood transfusion should be given and be followed immediately by emptying of the uterus. The latter procedure without preliminary transfusion is often fatal. In the past since death so often occurred in the course of anaesthesia given to permit curetting these fatalities were classified as due to anaesthesia whereas the true cause was haemorrhage and shock.

Dangers

The main dangers are incompatibility haemolysis and acute dilatation of the heart.

Incompatible blood transfusion results in respiratory distress cyanosis mental excitement and coma death occurs usually within two hours. Under hospital conditions it can be avoided by strict adherence to the rule of simultaneous compatibility tests by two different persons as indicated in this article under the heading Methods. If any suspicion of incompatibility arises during the transfusion the procedure must be stopped at once.

Haemolysis will occur if the bloods are incompatible, or it may result from over heating of the blood in the container. The duty of maintaining the blood in the container at body temperature is usually delegated to an assistant. If the assistant allows this blood to get more than a few degrees above the body temperature at any time after collection haemolysis may occur in the recipient's body with the formation of haemoglobin casts in the renal tubules and death from anuria six to twelve days later. If haemolysis is suspected large doses of alkali should be administered to prevent the formation of haemoglobin casts (Baker and Dodds 1925).

Acute dilatation of the heart can be avoided by running the blood in at a proper rate. This complication should be specially watched for in cases with anaemia of some days standing in which fatty degeneration of the myocardium may be present. If acute dilatation of the heart occurs venesection must be performed at once for its relief.

The number of blood transfusions given in the Glasgow Royal Maternity and Women's Hospital were eleven in 1932 twelve in 1933, forty-three in 1934 105 in 1935, and 165 in 1936. The average number of deaths from haemorrhage in the hospital for the five years 1930 to 1934 inclusive was 21.4 per year. In spite of the increased number of transfusions in 1935 sixteen deaths occurred from haemorrhage. The reason for this is that although transfusion was at that time being largely used for haemorrhage cases the worst cases still proved fatal because there was no means of securing suitable donors quickly. Similarly in the first six months of 1936 eight patients died from haemorrhage.

The new transfusion service was started in the middle of June 1936. In the second six months of 1936 only two patients died from haemorrhage. The two deaths from haemorrhage since June 1936 were both in cases of rupture of the uterus one of which was not diagnosed. In the other a blood transfusion was given but at the operation the bleeding points were not secured adequately,

and further unrecognized internal bleeding occurred. On analysis of the deaths from hæmorrhage recently it would appear that of the previous twenty cases annually about fifteen could have been saved by transfusion but about five each year would have died despite transfusion owing to shock or to continued bleeding.

Further Requirements

What is still required is a method of keeping blood in stock similar to the storage of saline solution in bottles for intravenous use. Patients have died within half an hour of admission. An intravenous saline injection can be started within ten minutes of admission and blood transfusion could be started in the same time if blood were kept in storage. I have had no experience of the Russian method.

Conclusion

From the statistics of the hospital about one fourth of the deaths are due to hæmorrhage. Of these deaths from hæmorrhage about three fourths can be avoided by transfusion within one hour of admission to hospital. This has required the organization of a blood transfusion service for this hospital. Blood transfusion services are organized in London and certain other cities but they should be organized by every obstetrical hospital when a public service is not available. These facilities should be extended to patients too ill to be brought into hospital at once and also to private practice in the area. For the smooth working of such a service the concentration of maternity work in a large centre with a highly skilled staff is preferable.

My thanks are due to the entire medical staff of the hospital for their co-operation.

S. C. Davidson and S. I. Warren (*N.Y. St. J. Med.* February 15, 1937, p. 387) review radiographs of twenty-four patients with infectious arthritis taken before and after treatment. The sole measures used were fever therapy alone or in combination with a hot bath routine. Before treatment each patient was physically examined, septic foci were removed and an electrocardiogram and a radiograph of the chest were taken. No dietetic regulations were enforced with the exception of an additional daily intake of one quart of milk. The patient was placed in a cabinet with the radiation from five 200-watt lamps directed at the trunk and limbs, the head remaining outside. The temperature was raised to 40.5 C. and maintained for four hours. A hot bath routine was carried out throughout the cold months of the year. Of twenty-four patients thus treated three showed no clinical or radiological improvement, six were clinically improved but there was no radiological evidence of definite change in the bony structures round the joint to support this improvement, thirteen showed clinical and radiological improvement. The authors analysed their cases and found that cases of infectious arthritis are resistant to fever therapy (a) when the disease is in the acute stage of soft tissue proliferation and (b) when the cartilage and bone atrophy have developed. These are usually persons under 30 years of age. In the subacute or chronic stage of infectious arthritis with thinning of the cartilage and bone atrophy in persons between 30 and 50 years of age marked improvement resulted. Two cases with definite hyper trophy of the joints showed complete relief from symptoms after fever therapy without any radiological evidence of diminution of bone space.

THE PREVENTION OF CONSTIPATION

BY

E. M. DIMOCK, M.D., B.Ch.

The progress of medicine is towards prevention. Yet constipation, one of the commonest ailments of civilization, receives only remedies. The present attitude of the medical profession towards constipation is deplorable. Students at many hospitals are brought up in an atmosphere where the indiscriminate use of purgatives is condoned. Too often the dose and type of purgative are left to the caprice of the nursing staff, and bear no relation to the experience of the patient. Recently, however, Professor Witts (1937) has shown that the treatment of acute constipation by purgation is irrational and his article should be read by every doctor and nurse. As a general practitioner I treat numerous patients suffering from habitual constipation. I claim that this is a preventable malady and that the continued use of purgatives is irrational.

Why the Abuse of Purgatives Continues

The general practitioner is apt to be discouraged by many obstacles which prevent the effective treatment of habitual constipation. First he is seldom instructed adequately on this subject while at hospital. Secondly the diagnosis of habitual constipation can only be made by the patient who is often misleading. Thirdly no single factor can be blamed as the cause of constipation and effective treatment must take into account all the circumstances in each case. At least four factors are commonly encountered.

1. The ignoring of the bowel habit or its lack of development.
2. Lack of physical activity.
3. Abuse of purgatives.
4. Unsuitable diets or artificially purified foods.

It follows that the treatment of habitual constipation is chiefly instructional. In actual practice this is so difficult that few doctors will make the attempt. Many patients have sedentary occupations while others cannot afford a suitable diet. Moreover there is nothing more difficult than to inculcate a habit into patients who have no use for any advice that requires personal trouble or thought. The rational treatment which at present is accepted by the medical profession does not utilize diet to the fullest advantage and even when applied correctly often fails altogether or only partially succeeds. It is discouraging for the doctor to take the time and trouble necessary to instruct his patients when his advice is not likely to be followed or when utilized is apt to fail. For these reasons the everyday treatment of constipation is largely disowned by the medical profession and is considered as the responsibility of the individual sufferer or parent and patient and physician are all more concerned with the relief of attacks of constipation than with the prevention of their occurrence.

Purgatives appear to offer a simple and effective solution for doctor and patient. Under the term "purgative" I include aperients, salines and all laxatives that are not purely mechanical. Not one of these is mechanical in action. I firmly believe that the treatment of constipation by purgatives is responsible for numerous cases of chronic digestive disorders, headache and nervousness.

Diet in Constipation

As constipation is practically unknown among savage tribes it would appear that a method is required which will overcome the disadvantages of our civilized diets and sedentary occupations. Such a method should aim at increasing the normal reflexes without hurrying food through the intestine before it is properly digested. With this object I have used diets with a high fibre content such as bran. This method of treatment is founded on the theory that the colon does not function normally unless it has a certain amount of cellulose residue in its lumen after the processes of digestion have been completed. Though every normal diet contains some of this residue the major part of it is eliminated by the modern preparation of food. It is the virtue of this treatment that it remedies this artificial deficiency and thus in my opinion prevents the induction of constipation. The advantages I claim for the method are that it is simple, inexpensive, harmless, effective and essentially physiological. As the use of food containing fibre has fallen into undeserved disrepute, and the value of diet for constipation has been grossly underestimated, I propose to give a short elaboration of recent work on this subject.

There is now ample experimental evidence showing that the laxative effect of vegetable foodstuffs depends upon their fibre content. The most important investigations on this subject have been done by G. R. Cowgill and Anderson (1932-3), G. A. Williams (1927), H. Morgan (1934) and W. H. Olmsted (1934, 1935). The type of fibre contained in vegetable food varies in the extent to which it resists the action of bacterial decomposition and the digestive juices. On this fact depends the value of the foodstuffs as a laxative agent. Thus the fibre of green vegetables and ordinary foodstuffs is more readily broken down in the alimentary tract than is that of wheat bran. This explains why the addition of fruit and vegetables to the diet so often fails to prevent constipation.

The Use of Bran

Cowgill (1933) states that the fibre of processed bran resists decomposition to a very considerable degree, and that as the use of bran is not attended with undesirable symptoms of any kind this product may be considered to have special value for constipated patients. Cowgill and Anderson (1932) showed that when a low fibre diet is given to normal people they become constipated, and that a physiological fibre minimum of 90 mg per kilogramme of body weight daily is necessary to prevent constipation in healthy individuals.

There have been repeated statements by clinicians that the foods which contain fibre and bran in particular irritate the alimentary tract. Although no proof has been forthcoming to support these opinions they have been widely accepted. In order to determine this point investigations have been carried out by Murphy and Jones (1926), Frey (1928) and Rose (1932) with various types of diet containing up to 50 per cent of fibre. No evidence of irritation was found. In a summary of literature M. S. Rose (1932) stated that from the use of bran injury to the alimentary tract has not been observed. From my experience of the employment of bran during the last five years I have yet to encounter any signs or symptoms of irritation. I have used it for approximately 250 patients old and young in bed or at work for those liable to peptic ulcer as well as for those with haemorrhoids, mucous colitis, and spastic colon. The only troubles ex-

perienced were with a few patients who disliked eating bran or had difficulty in chewing it or who complained of the lack of variety of these products.

Some writers state that bran distends the intestines, implying stretching of the gut wall to a harmful extent but as bran forms a soft pulpy mass it would require accumulation behind an obstruction to produce abnormal distension. Objections have been raised because of the possibility of intestinal obstruction by bran. This is a bogey when used correctly bran cannot cause obstruction though in rare cases this has occurred when bran has been taken despite stubborn constipation.

Fibre by virtue of its power to retain moisture is a mechanical laxative. Under conditions of intestinal stasis it is gradually dehydrated and therefore is useless for the relief of established constipation. Bran and all dietetic measures relying on the action of fibre should only be used for *prevention* of constipation. I believe clinicians have discredited bran because they have found it to fail when the patient is constipated in other words when this form of treatment is not indicated. The erroneous impressions gathered from the incorrect use of bran has been perpetuated by the labelling of this substance roughage. This term implies a coarse mechanical irritant. The soft moist stools produced when bran is used correctly cannot irritate the mucous membrane. Bran is also labelled indigestible whereas it is merely inert and certainly does not give rise to indigestion. Any person who can eat fruit and vegetables with impunity, can obtain proof of the harmlessness and effectiveness of bran by taking one of the processed products himself. These processed products are not made from the husk or chaff of wheat but from the outer layers of the wheat or rice grain. They are made palatable with malt and sugar, and contain 5 to 15 per cent of fibre.

Technique of Use

The instructions to the patients are given under two headings: (1) treatment of constipation if present, (2) prevention of future constipation.

(1) Most constipated patients know which medicine suits them and how much to take. The practitioner should be prepared to treat each patient as an individual in the matter of laxatives and the patient's confidence will be retained if he is allowed to use the medicine that has been successful on previous occasions. The patient should be instructed to avoid purgation. When mild constipation is present I prefer magnesia or emulsions of liquid paraffin which at first may be given in half-ounce doses morning and night. Senna or a pill such as pil. aloin. co. may be used in moderately severe cases. Glycerin suppositories are also useful. For stubborn cases enemata consisting of plain water or saline are much more satisfactory than large doses of purgatives.

(2) I have used bran as the mainstay of my treatment combined with the use of a laxative as long as is necessary. Bran should not be added to the diet when constipation is actually present. The bran should be taken daily for a minimum period of four weeks and as laxation increases the laxative given may be gradually reduced and finally left off. Bran is usually taken with milk and sugar for breakfast or the evening meal. Some people like to mix it with other breakfast cereals or porridge. The amount taken varies from one tablespoonful to a large cupful. Half a teacupful is an average quantity. In stubborn cases it may be necessary to give bran twice a day before the patient's usual dose of purgatives can be reduced. I have not found that the effect of the bran diminishes with use,

nor that more is required, rather there is a tendency for patients to return to normal bowel habits and for less bran to be necessary

The Patients

Eighty per cent (121 cases) of my patients suffering from habitual constipation have utilized the bran method of treatment. Of the remaining 20 per cent 8 per cent were relieved by increased exercise and vegetarian diet and the omitting of purgatives, and the remaining 12 per cent did not care for the method.

The 121 cases which form the material of my follow up consist of 110 cases of simple habitual constipation, nine of spastic colon, and two of mucous colitis.

Simple Habitual Constipation

The following table gives the men and women under the classification that I have adopted

Type of Result	No. of Women	No. of Men	Total	Per centage
A. Patients who return to normal and do not require bran	28	14	42	38
B. Patients who return to normal, but require a maintenance dose of bran	41	16	57	52
C. Patients who in addition to taking bran regularly occasionally require a laxative	5	—	5	4.5
D. Patients who have not been improved—that is failures	6	—	6	5.5
Total	80	30	110	100

Thus 90 per cent of my patients (Types A and B) have become normal and a further 4.5 per cent approximately normal (Type C).

Type A—Once a patient has succeeded with bran he or she rarely reverts to purgatives again except in an emergency. The patients who become quite normal usually find that a little bran helps them out of any future tendency to constipation. The time taken to attain normality varies considerably. Some are immediately successful and others after a period of years find that bran can be left off.

Type B—Most of the patients in this group have had long standing constipation or have poor musculature and/or sedentary habits. They require a maintenance dose of bran. This group also includes those patients who need bran only once or twice a week and some who have started treatment recently and may be able to leave it off later.

Type C—All these patients were women and had had severe constipation as long as they could remember. No previous method had given them a satisfactory result but they now obtain regularity when taking bran together with a mild laxative such as magnesia. It is significant that although none of these particular patients like eating bran they all continue to take it.

Type D—There were six women patients who did not find bran useful after a prolonged trial. These patients were all in the same age group the youngest being 37 and the oldest 50. It is well recognized that constipation is prevalent and difficult at the time of the menopause also that laxation is affected by the monthly periods. In contrast to the other groups no increase in the amount of stool passed was noticed by these patients. This would tend to support a suggestion by Coe (1937) that in constipated patients fibre is more readily broken down in the alimentary tract than in normal people.

Of fifteen patients who at first disliked eating bran but who were willing to take it, only four have reverted to other methods.

When I divided my patients into two groups—(i) those constipated more than ten years, (ii) those constipated less than ten years—I found all but one of the failures and partial failures had been constipated for more than ten years. Further, those patients who had been constipated for a long time recovered less easily. In contrast to this the apparent severity of the constipation did not influence the prognosis as much as the length of history.

Use of Bran in Special Conditions

1 Haemorrhoids—Seven of my patients had symptoms of haemorrhoids when treatment began and eleven others gave a history of haemorrhoids. When haemorrhoids were present the degree of laxation aimed at was two formed soft stools each day until symptoms disappeared. Otherwise the treatment was similar to that used for uncomplicated constipation. There have been good results in every case the haemorrhoids disappearing without any special or local treatment. In no instance did the use of bran increase the symptoms nor has there been any recurrence. The eighteen patients in this group have been particularly pleased with the bran treatment.

2 Mucous Colitis—The two cases I treated were both attributable to purgatives, they lost all symptoms including mucus, within two months, and have not relapsed during the last two and three years respectively.

3 Spastic Colon—These cases offer an excellent opportunity for preventive medicine. My experience has led me firmly to believe that constipation provokes the attacks in susceptible persons. Almost all of these patients have habitual constipation, I have found this can be prevented by the use of bran and then attacks of spasticity are very unlikely. It is perfectly clear to those engaged in private practice that the attacks are short and the intervals long. Good results from the use of bran are not to be expected when spasticity is present, for the patient is constipated. In my opinion the reason why bran has been regarded as irritating in this condition is because there has been no distinction between the attack and the interval.

Psychology

Everyone who has treated individuals suffering from constipation realizes that a strong psychological element is involved. The patients are apt to think that they are ill and the necessity for taking medicine confirms them in this view. Bran is regarded as a food, not as a medicine by the lay public and the patient who secures satisfactory laxation by the use of bran rapidly ceases to regard himself as a person requiring treatment and his hypochondria diminishes correspondingly. My experience is that patients who are successful with bran have a psychological advantage over those who are successful with laxatives. Bran taken as a cereal at mealtime becomes a habit and does not tax the memory. When established the exact dose is unimportant. A missed day does not give rise to anxiety or call for interference as an enema is certain on the following day. Moreover there is a prolonged hang over action laxation continuing normally several days after the bran has been left off. The great majority of my patients have attained normality and the subject of laxation has then become unimportant.

The improvement in these patients is so striking in the majority of cases that few attend sufficiently often to facilitate a follow up. The value of the treatment

only ascertained at the time of the next ailment. This amnesia does not occur when purgatives and mechanical laxatives are taken. It is necessary to remember to take medicine and to gauge the dosage with the results obtained. It is seldom that they produce the clocklike regularity experienced with bran. Many patients who take purgatives experience symptoms such as flatulence, headaches, colicky abdominal pain and sometimes alternate between constipation and diarrhoea. In such circumstances how can they be anything but colon-minded?

Prophylaxis

Bran may be used as a prophylactic agent to prevent the occurrence of constipation in patients who are (a) constitutionally liable to constipation (b) placed in circumstances which may produce constipation.

(a) Some patients who are liable to attacks of constipation ward them off with bran once a week. Its action gradually diminishes over a period of three to eight days in the patients who find it effective in this way. I believe that bran is a useful prophylactic against the attacks of spastic colon.

(b) Bran can be used during the post operative antenatal and post natal periods. Other laxatives are often necessary as well but it is not difficult to minimize them especially if the patient has used bran previously. As the occurrence of constipation often dates from childbirth or an abdominal operation prevention of constipation is particularly important at these times. The influence of different localities on the laxation of certain people has never been satisfactorily explained. The water supply has been indicted but a recognized authority on water supplies (Thresh, 1932) states that hard water is not known to cause constipation. One of my patients who varies between normality in Hampshire and obstinate constipation in Hertfordshire has obtained no benefit from the use of a water softener. Many people become constipated when travelling and bran as a prophylactic is much superior to the purgatives usually employed.

Summary

The principle for the use of high fibre diets for constipation has not been appreciated. High-fibre diets should be used for prevention and not for treatment.

Investigations have shown that (1) the laxative value of foodstuffs depends upon the type of fibre contained therein (2) the fibre of wheat bran is much more effective than that of fruit and vegetables (3) no evidence of irritation of the alimentary tract by bran has been observed.

The nomenclature in common use has been criticized.

One hundred and twenty-one patients with habitual constipation 80 per cent of the total, were treated with processed bran. The results in 110 cases of simple habitual constipation showed that the treatment was successful in restoring normal bowel habits in 90 per cent of the cases that women were more common sufferers than men in 3 to 1 ratio that the menopausal age is the most difficult and that the prognosis and rapidity of response to treatment depend upon the length of the history of constipation.

The psychological benefit conferred on these patients is contrasted with the outlook of the patient taking laxatives.

The importance of prophylaxis is emphasized.

The results in patients with haemorrhoids were particularly encouraging.

Two cases of mucous colitis due to purgatives were successfully treated by bran.

In spastic colon the importance of the prevention of constipation during the intervals between the attacks is emphasized for it is suggested that constipation induces spasticity in the susceptible person.

The processed bran used in the investigations was Kellogg's All Bran.

TREATMENT OF CARCINOMA BY INSERTED RADIUM PLAQUES

BY

H S SOUTTAR, Ch M, F.R.C.S.

Surgeon to the London Hospital

Probably the most important factors in the successful irradiation of carcinoma are that the irradiation should be uniform over the whole region under treatment and that its amount should be accurately known. In the possibility of satisfying these conditions lies the real advantage of radiation from a distance whether by large radium units or by x rays.

The insertion of seeds or needles into the tissues however skilfully carried out can only give a very rough approximation to the result desired and in any event there must be a number of points of excessive irradiation and local destruction of tissue. The method which I propose to describe avoids such local damage while retaining the convenience and economy of seeds and needles moreover in the regions where it is applicable it would appear to meet with a high degree of accuracy the conditions we have stated as fundamental.

Method of Procedure

The method consists in the introduction into the tissues of small plaques made of dental wax and carrying within the wax the seeds or needles used as sources of radiation. The latter are so arranged as to give the flattest possible

FIG 1—Showing form of plaque and incisions for introduction

field and where it is possible to introduce two opposing plaques these can be so arranged that the whole of the intervening tissue receives an almost uniform radiation.

If introduced into suitable tissue planes the plaques are readily tolerated and if they are removed at the end of four or five days the small wounds made for their introduction heal without difficulty. As no foreign body has been left in the tissues additional radiation from an external source may be at once applied should this be desired.

Application to Post-cricoid Pharyngeal Carcinoma

I shall describe the method in relation to pharyngeal carcinoma in the post-cricoid region to which it is particularly applicable. An incision four or five centi-

FIG. 2—Outer wall of pharynx exposed by blunt dissection.

FIG. 3—Internal of larynx and pharynx.

metres in length is made on each side of the larynx dividing the skin and platysma. When it will be found that a fascial space can be opened up between the larynx and the great vessels so that both sides of the larynx and pharynx from the hard bone downwards are exposed

with facility. The only important structure crossing the space is the internal laryngeal branch of the superior thyroid artery and this is divided between ligatures.

Two circular plaques have been prepared three centimeters in diameter and consisting of four layers of dental wax between which the seeds or needles are suitably arranged whilst a piece of tape is inserted to facilitate removal. The plaques are inserted fixing one on either side of the pharynx which is thus subjected to a cross fire resulting in a very uniform field of irradiation. The incisions are closed by a few stitches leaving the tapes projecting. At the end of three days the incisions are reopened the plaques removed and the incisions again sutured. The inconvenience to the patient is remarkably small.

As regards the quantity of radium required if twenty-five radon seeds of 1 millicurie each are distributed radially around the margin of each plaque at the end of three days there will have been 21 millicuries destroyed and if the plaques are four centimetres apart the whole of the intervening tissues will have been subjected to an irradiation of just over 6000 *r* units.

Other Applications

The method as described is applicable to the lower pharynx, the larynx, and the sinus pyriformis. With suitable modifications it may be applied to the tonsil and to the vallecula and the root of the tongue and even to the cervical oesophagus. No doubt it has many other applications but here it appears to be peculiarly suited and to meet effectively cases of a difficult class. The number of cases in which it has been used is too small to justify conclusions but the results have been encouraging and would seem to indicate both the safety and effectiveness of the procedure.

A. Paskiewicz (*Rev. Laryng.* January 1937 p. 40) discusses a special group of foreign bodies in the trachea and bronchi such as beans, peas, maize and soft stones of fruit all of which have the property of expanding when living in contact with the tracheal and bronchial mucous membrane after aspiration. The foreign body may lie in the right bronchus at first. As it expands the coughing efforts sometimes dislodge it and it may come to lie near the bifurcation causing death by obstructing the left bronchus as well. Soft foreign bodies also lead to rapid suppuration of the mucous membrane with the formation of pulmonary abscess as do fish bones and small pieces of wood. Before the invention of the bronchoscope the mortality of expanding foreign body was 52 per cent. At present the mortality is still 27 per cent because bronchoscopy removal presents great technical difficulties. The foreign body often breaks into several parts when seized with the ordinary type of bronchoscopy forceps. Special forceps ends have been invented also hooks which simply dislodge the foreign body without seizing it. After loosening them in this manner they are sometimes coughed up especially if a tracheotomy opening has been made. In infants and children a choice must be made between upper and lower bronchoscopy. For many reasons the author prefers lower bronchoscopy. The endoscopic tube being introduced through a tracheotomy opening. In upper bronchoscopy if the tube has to remain in the larynx of a child it is more than fifteen minutes there is considerable oedema of the glottis. The article includes eight photographs of children with these deaths.

PRESENT-DAY METHODS OF STERILIZING DRESSINGS

BY

S N HAYES, FRCS., FCOG
MAJOR IMS

*Medical Superintendent Lady Willingdon Hospital Lahore
India*

The modern ritual of asepsis enables surgical procedures to be carried out with an almost monotonous freedom from complications caused by infection. Nevertheless from time to time disturbing features arise that have not up to now been satisfactorily explained. A surgeon finds wounds that should heal by first intention breaking down. Cases of tetanus following operation are occasionally reported. The obstetrician has sporadic cases of infection and hospitals and nursing homes are afflicted—fortunately rarely—by epidemic sepsis. For many years my own work has been partly concerned with highly infected labour cases. It was not difficult to imagine that unless the aseptic technique was efficient spread of infection involving 'clean' labour and gynaecological cases was not improbable. This led me five years ago to undertake the investigations outlined in this paper.

The sterilization of boilable articles for fifteen minutes is generally accepted as efficient. The sterilization of dressings although accepted appeared to be something of a mystery. My own knowledge was scanty. I knew that dressings such as abdominal sheets, towels, swabs, wool, overalls, gauze, caps, masks, etc. were packed into drums or bags and placed in a sterilizer into which steam was admitted until a certain pressure was reached. Twenty minutes later the dressings were considered as sterile. I find that the knowledge of many of my colleagues is just as limited. It has always appeared to me somewhat strange that we should accept dressings as bacteriologically sterile merely because they have been treated in a high pressure sterilizer. Under the present methods in vogue there is no proof whatsoever that such dressings are sterile.

Some Disturbing Facts

Inspection of six large hospitals revealed many disturbing facts illustrating the haphazard methods in use. It is assumed that the methods of six different hospitals each under separate administration may be taken as fairly representative. A few examples are as follows:

1. All the surgeons were convinced that their dressings were sterile even though they had no knowledge of the details of the technique of sterilization.

2. In only one case was there any real supervision by a sister. The packing of the drums was performed chiefly by probationers in one instance of one month's seniority. The actual sterilizing was done either by a staff nurse or by a subordinate who could not be classed as responsible.

3. In one hospital the steam inside the sterilizer was raised to a pressure of 20 lb per square inch and then the main steam supply was cut off. After twenty minutes the dressings were said to be sterilized.

4. In only one hospital were dressings intelligently packed. In all others they were simply crammed into drums or bags. At one hospital it was astonishing to see the enormous quantity of cotton wool which had been forced into a drum.

5. In another hospital the dressings after returning from the steam laundry were allowed to lie on an unclean floor.

6. The knowledge displayed by all concerned was either nil in which case they said "We have been taught this way" or else they were simply following the manufacturers' instructions.

Perfect sterilization should be simple. It merely consists in subjecting every part of the dressing to a certain temperature for a definite period. This period must be decided by the bacteriologist and given the correct period of time all bacteria and spores will be destroyed.

Scope of Investigation

It was decided to investigate the following problems:

- (a) What is the temperature and the duration of that temperature required to produce bacteriologically sterile dressings the heat being applied by means of steam under pressure?
- (b) How can it be proved that the necessary temperature is reached and maintained?
- (c) Can steam under pressure penetrate dressings with ease?
- (d) Does the type of material, the method of packing and the type of container affect the penetration of steam?

All these questions are answered by the experiments undertaken and an endeavour is made to lay down a definite technique under accurate control to replace what is considered to be a rule of thumb and inaccurate method. The great variety of results obtained by experiment indicates that the standard method of sterilization at present in general use—that is by steam at a pressure of 15 or 20 lb per square inch for twenty minutes—is far from accurate. (Recently some manufacturers have recommended thirty minutes.) This method is based on the assumption that steam penetrates dressings almost immediately. This is incorrect. Working with steam under pressure at a temperature of 126 °C I have found delay varying from one to seventy-two minutes in reaching a temperature of 115 °C—it is 11 °C less than that of the steam in the centre of a dressing drum. Steam under pressure should no longer be regarded as an agent that has remarkable powers of penetration. Unless certain conditions are observed it penetrates extremely poorly.

It is rarely that dressings are suspected or blamed as the cause of infection. The explanation may be due to the undoubted fact that we all have such implicit faith in a steam sterilizer or that it is impossible ever to carry out any bacteriological tests after the infection has occurred as by that time the dressings will have disappeared. I suggest that it is as logical and necessary to inquire into the efficiency of the sterilization of dressings as it is to swab nurses' throats or to blame the theatre sister or the catgut.

Time and Temperature

Textbooks, although insisting that sterile dressings are a necessary adjunct to successful operations, are somewhat indefinite as to the details of sterilization. Examples are: "in a high pressure steam sterilizer one hour at 10 lb (115 °C) will be sufficient" (Berkeley and Bonney 1935), "use steam pressure" (Blair Bell 1934).

In a steam sterilizer (Crossin 1930) "The information required is clearly—what is the temperature and duration required to kill all vegetative and sporing forms of bacteria?" I suggest that this information should be made available and be inserted in all textbooks in which the sterilization of dressings is mentioned.

It was decided to adopt the standard used by bacteriologists when sterilizing media, etc.—that is:

1. Fifteen minutes exposure to steam at 15 lb per square inch (121 °C) above atmospheric pressure will kill all forms of organisms including the most resistant spores (Mackie and Macartney 1934).

2. For practical purposes, from common knowledge 115 °C for twenty minutes is invariably fatal to tetanus spores (Medical Research Council 1924).

Vacuum and Non-vacuum Sterilizers

The most expensive sterilizers are fitted with a vacuum producing mechanism. The principle involved is that a vacuum is first produced inside the sterilizer, thus withdrawing all air and moisture from the dressings. Steam is then admitted, and as there is a negative pressure, rushes into the interstices of the dressings.

showed again that the tight packing of a sterilizer is a dangerous practice, and it emphasizes, too, the value of a control.

Technique of Dressing Sterilization

As so many factors can influence the efficiency of sterilization, the processes of packing drums and of sterilization should be considered as requiring a definite technique and adequate supervision.

GROUP IV—Experiments to test the efficiency of vacuum and non vacuum sterilizers. 0 = the time when the steam pressure inside the sterilizer reached 20 lb per square inch (126°C)

Theoretically therefore, more efficient penetration is produced by a vacuum sterilizer. Experiments were conducted with a sterilizer of similar size to that used in Group I except that a vacuum apparatus was fitted. The vacuum had no apparent effect in assisting penetration. Further experiments with vacuum sterilizers are shown in the Group IV chart, and these indicate that the large vacuum sterilizer has no superiority over the non-vacuum type. As the number of experiments made on vacuum and non vacuum sterilizers is small no dogmatic conclusion can be drawn but it may be pointed out that whether a vacuum is or is not used an efficient method of control is still necessary. A vacuum can give no extra measure of safety without efficient control.

Group V experiments compare the efficiency of five different sterilizers. The time to reach the temperature when sterilization begins varies from one to nineteen minutes. This again proves the futility of sterilizing for a standard time without control. In tests to find whether a vacuum sterilizer was of greater value when its action was prolonged experiments indicated that in a large sterilizer prolongation of the vacuum action did produce increased efficiency, but prolongation of the time was of no value in small sterilizers.

Further experiments tested the efficiency of khaki-drill bags as containers for dressings. They appeared to be moderately efficient providing that the sterilizer was packed loosely. If however the sterilizer was packed tightly they were definitely inefficient. This experiment

- 1 Perforated drums should be used
- 2 Each drum should be filled in a definite manner which should never be varied. The contents of the drum should

GROUP V—Experiments to compare the efficiency of five different sterilizers, using the same control drum which contained thirteen towels and was unopened throughout. 0 = the time when the steam pressure inside the sterilizer reached 20 lb per square inch (126°C)

then be marked on a label attached to the drum. All articles should be *loosely rolled* and placed end on in the drum.

N.B.—Cotton wool before packing, should be unrolled and exposed to heat. It will then swell to twice its original thickness.

Great care should be taken to pack the drum lightly.

3 The sterilizer should be fitted with a control of the type described.

4 With the control in the centre of the drum each drum should then be tested in order to ascertain the time taken for 115° C to be reached. This time should be recorded on the drum label.

5 When sterilizing the control should always be inserted into the drum of dressings which are the most resistant to steam—as indicated by the time taken to reach 115° C.

6 Supervision by a responsible member of the nursing staff is necessary to (a) see that all drum perforations are open before sterilizing begins (b) see that the perforations

3 A simple control has been devised which accurately indicates when the sterilizing temperature is reached inside a dressing drum.

4 Experiments were first made on seven high pressure sterilizers of different types using a liquid control. These experiments are not published as it was considered that the control was not accurate. The results in general showed that sterilization was inefficient.

5 Further experiments were made using the electric control described on four different types of sterilizer. The conclusion is that present day methods of sterilization are inefficient unless a definite technique is adopted.

6 Steam under pressure is not considered as having remarkably efficient powers of penetration.

7 Carelessly packed drums, unperforated drums and tightly packed sterilizers have been shown to obstruct the penetration of steam.

8 A technique of sterilization has been suggested and the necessity for an adequate control indicated.

GROUP VI—Experiments to show the degree of penetration of steam using drums packed according to the technique described and as used in this hospital L.W.H. sterilizer as in Group I. The drums are described as large (L), medium (M) and small (S). 0 = the time when the steam pressure inside the sterilizer reached 20 lb per square inch (126° C).

are closed immediately after sterilization (c) see that a temperature of 115° C. is maintained for at least twenty minutes (d) see that the contents of the drums never vary from the optimum found by previous testing, and that the packing is according to instructions.

Note—To be strictly accurate each drum should contain a temperature control. This is not practicable and it is thus impossible to obviate the human element which might easily result in drums being improperly packed. To overcome this it is suggested that over and above the precaution advised in paragraph 5 above the time of sterilization should be increased by 50 per cent.

The Group VI experiments show the degree of penetration of steam through drums packed according to the standard technique described above. The uniformity of penetration is in marked contrast to that shown in the previous experiments.

NOTE ON STERILIZER CONTROL

The control can be obtained from Messrs Negretti and Zambra High Holborn London. Insulated terminals for the sterilizer door or lid can be fitted by any engineer. The wires connecting the thermometer to the inside terminals should be heavily insulated and covered with silk. The outside connections and indicator board can be made by any electrician.

Summary

1 Experiments have been made to ascertain whether present-day methods of sterilizing dressings are efficient.

2 A standard of sterilization necessary to produce bacteriologically sterile dressings has been adopted.

9 It is suggested that imperfectly sterilized dressings are a likely cause of unexplained wound infections and epidemic and sporadic puerperal sepsis.

My thanks are due to Drs H. B. Dunncliffe and H. W. Sun of the Central Board of Revenue Control Laboratory, Lahore for their kindness in giving me technical advice, carrying out tests, and experimenting with various types of controls, also to Sister Young for supervising the packing of drums and to the hospital mechanics for their laborious work under trying conditions.

On the occasion of the International Congress of Ophthalmology to be held at Cairo from December 8 to 15 1937 several trips in the Orient have been organized under the auspices of the International Council of Ophthalmology, leaving Marseilles on December 3. The programme giving full particulars of these trips will be sent free of charge on request addressed to the Bureau des Croisières et Voyages Médicaux 29 Boulevard Adolphe Max Bruxelles Belgium. Doctors who are not ophthalmologists may up to the limit of accommodation available register their names for any of the trips so long as their applications are approved by the International Council of Ophthalmology, though they will not be able to take part in the special work of the congress.

GASTRO-ENTERITIS ASSOCIATED WITH
PROTEUS VULGARIS

BY

J D ALLAN GRAY, M.B., B.Sc., F.R.C.P. Ed.,
D.P.H.(From the Preventive Medicine Department University of
Bristol)

An outbreak of acute gastro-enteritis affecting at least eighteen individuals occurred in Avonmouth during the night of September 11, 1936. All the affected individuals had partaken of cockles sold by an itinerant vendor on the evening of that day, and only one person could be found who had eaten some of the cockles and who had not been ill. After an incubation period varying from three to six hours the illness commenced with headache, nausea, abdominal pain, vomiting, diarrhoea, and prostration. There was no pyrexia. With the exception of two cases the individuals affected were not seriously ill and had practically recovered within twenty-four or forty-eight hours. There were no deaths. The two patients who were seriously ill recovered in seven to ten days.

Considerable difficulty was experienced in tracing the vendor of the cockles, but largely owing to the indefatigable efforts of the chief sanitary inspector aided by the police and interested patients he was finally traced. The vendor was in the habit of receiving seven or eight bags of cockles a week from South Wales. On their arrival at his premises his routine procedure was to steep the cockles overnight in water in a pan to which salt had been added. This removed the larger portion of the sand present. The following morning the cockles were placed in a bucket with a perforated bottom and lowered into water boiling in an ordinary washing copper. This reduced the temperature of the water, but as soon as the water boiled again the bucket was removed, emptied, and refilled, and the process repeated. The heating loosened the cockles in their shells and allowed of their being riddled into either a small or large galvanized iron bath containing water and salt. The empty shells which remained in the sieve were discarded.

Close questioning elicited the fact that the vendor, his wife and family were in the habit of performing their personal ablutions in the larger of these two baths when it was not actually being used for the preparation of the cockles. In the process it will be seen therefore that the cockles were washed in three lots of water and that the only heat to which they were subjected was when they were brought to the boil—a procedure occupying at most about two or three minutes. Further, when the bath used for the personal washing of the vendor and his family was employed to hold the cockles the latter were not subsequently subjected to heat or otherwise cleaned before being sold.

The premises in which the cockles were thus prepared consisted of a small cellar nearly completely underground, ill ventilated, and containing an accumulation of litter and rubbish. Both floor and ceiling were defective and the walls were dirty. The vendor, his wife and family of six children all appeared healthy and had no symptoms relating to enteritis. He had carried out the business of selling cockles in different parts of Bristol and the surrounding villages for twelve years, and up till now had not been questioned. Inquiries among practitioners of districts other than Avonmouth where the vendor had sold cockles failed to disclose the occurrence of any cases of enteritis which could in any way be attributed to him.

Bacteriological Findings

Owing to the rapidity with which most of the patients recovered only two samples of stools in the liquid state were obtainable. Vomits were not secured. Throughout the investigation all the faeces examined failed to show the presence of organisms of the enteric, dysentery, or food-poisoning groups.

Case 1 (W.B.)—Faeces examined on September 14 by which time the patient had completely recovered, were hard and contained numerous atypical *B. coli*. *Proteus vulgaris* was not found.

Case 2 (C.W.)—The faeces on September 14 were still very diarrhoeic and contained *Proteus vulgaris* (motile spreading) and late lactose fermenting *B. coli*. A blood culture taken on September 18 was sterile. A serum test on September 18 in dilutions of 1 in 25, 1 in 50, 1 in 125 and 1 in 250 did not agglutinate the Standards Laboratory suspensions of *Bact. typhosum*, *H. Bact. typhosum*, *O. Bact. paratyphosum A*, *Bact. paratyphosum B*, *Bact. enteritidis*, Gaertner *Bact. aertrycke* (sp.) composite non-specific *Salmonella*, *Bact. newport* (sp.), *Bact. sinensis* (para C) (sp.), and *Br. abortus*. The titres for various strains of *Proteus* are given in Table I.

TABLE I—Serum of Case 2

	25	50	125	250
(1) HXK (Nat. Coll.)	++	±	-	-
(2) OAK "	++	±	-	-
(3) HX2 "	++	+	-	-
(4) OX2	++	++	±	-
(5) OX19 "	++	+	±	-
(6) <i>Proteus mirabilis</i> (N.C.)	-	-	-	-
(7) OX19 (Standards)	++	+	-	-
(8) Case 2's strain	++	++	++	±
(9) Case 3's strain	++	++	++	±

++ = Complete agglutination.
+ = Incomplete agglutination.
± = Trace of agglutination.

The first six strains were obtained from the National Collection of Type Cultures and the seventh from the Standards Laboratory at Oxford. At 1 in 25 and higher dilutions the serum did not agglutinate the atypical *B. coli* from Case 1 and the late lactose fermenting *B. coli* from his own faeces. In a further examination of the faeces on September 23 *Proteus vulgaris* and late lactose-fermenting *B. coli* were not found, but streptococci and *Bact. aerogenes* were present. The serum findings on September 25 were identical with those of the sample obtained on September 18 except that the titre for the patient's own strain of *Proteus vulgaris* had fallen slightly, so that complete agglutination was obtained at 1 in 50 and incomplete at 1 in 125. Almost identical results were secured with the strain of *Proteus* isolated from the bath (see below).

Case 3 (E.W., wife of Case 2)—Faeces examined on September 14 gave a growth of *Proteus vulgaris* (motile spreading). A suspension of the organism was agglutinated by the sera of both Cases 2 and 3 up to but not beyond a dilution of 1 in 25. When fed to mice it had no ill effects. Her serum on September 18 gave reactions similar to those of her husband's serum (see Table II). A blood culture made on September 18 was sterile. From the faeces (September 23) typical *B. coli* only were obtained. In a serum test on September 25 no alterations in the titres of the suspensions of *Proteus*

vulgaris were found and the serum still failed to agglutinate the Standards Laboratory suspensions of enteric and food poisoning organisms

Unfortunately samples of cockles were not obtainable for examination either at the houses of the affected patients or on the premises of the vendor. All the vessels used by the vendor in the preparation of the cockles were therefore rinsed with sterile saline, and the resulting rinsings as well as a sack in which the cockles had been delivered, were examined, without success for organisms of the food poisoning enteric, and dysentery groups. *Proteus vulgaris* (motile spreading) was found in considerable numbers in the bath which had been used for the ablutions of the vendor and his family before and after the final rinsings of the cockles. The organism was

TABLE II—Serum of Case 3

(7) OX19 (Standards)	++	++	±	—
(8) Case 2's strain	++	++	++	—
(9) Case 3's strain	++	++	++	—

++ = Complete agglutination.
+ = Incomplete agglutination.
± = Trace of agglutination.

not found in the washings from any of the other vessels or in the sack. The strain of *Proteus* was agglutinated by the sera from Cases 2 and 3 (see above).

"All three strains of *Proteus* isolated—that is from the faeces of the second and third cases and from the bath—liquefied gelatin, produced indole and gave identical sugar reactions. Thus all failed to ferment lactose, dulcitate, and mannite, and all produced acid and gas in glucose, saccharose, maltose, and salicin."

Samples of faeces, blood for blood culture and sera for agglutination were obtained from both the vendor and his wife on September 22. Neither of the faeces yielded *Proteus vulgaris* or other pathogenic organisms, although that of the woman contained some late lactose fermenting *B. coli*. The blood cultures were both sterile and the sera in dilutions of 1 in 25 and higher both failed to agglutinate any of the suspensions of *Proteus vulgaris* or any of the Standards Laboratory's suspensions of enteric or food poisoning organisms.

Discussion

Previous outbreaks of food poisoning for which *Proteus vulgaris* has been held responsible have been recorded by Glücksmann (1899), Silberschmidt (1899), Pfuhl (1900), Demnitz (1926), and Wilson (1929). Usually however the evidence has not been convincing and it is to be noted that the majority of these were reported prior to the obtaining of the more exact knowledge held to day of the *Salmonella* group. In the case recorded by Demnitz, however, the agglutination of the *Proteus* suspension by the patient's serum at a dilution of 1 in 400 considerably strengthened the evidence for attributing the patient's diarrhoea to that organism.

In the investigation of epidemics of acute gastro-enteritis not due to the ingestion of food in itself inherently poisonous or contaminated with a chemical poison, considerable caution must be exercised in attributing responsibility for the outbreak to any organism other than staphylococci or members of the *Salmonella* group. This is especially true when a *Proteus* is suspected for, as Savage (1929) has written, "The evidence that organisms like *B. coli*, *B. proteus*, or Morgan's bacillus can cause food poisoning is slender, and although many outbreaks have been attributed to them critical investigation does not substantiate the association." Bengtson (1919) held a similar view. It is on account of the rarity of cases of food poisoning justifiably regarded as due to *Proteus vulgaris* as well as on account of the hygienic lessons to be learned that this outbreak is here recorded.

It is suggested that the evidence given is sufficient to incriminate *Proteus vulgaris* as the cause of the outbreak. Admittedly the organism may be present though never in large numbers, in the stools of normal individuals and enteric patients (see Wilson, 1929), and the secretion of inflamed surfaces such as enteric and dysenteric ulcers appears to offer a suitable pabulum for its development. It is conceivable, therefore, that the *Proteus* found was an invader secondary to another organism, but the interval for such a sequence of events seems to be unduly short. Further, the serological reactions of Cases 2 and 3 suggest an aetiological significance not only on account of the titre (125 in each case), but also on account of the fall in titre in the second patient from 125 to 50 in one week.

According to a pamphlet issued in June 1936, by the Standards Laboratory the limit of normal agglutination for the strains of *Proteus* OX19, OXK and OX2 is 1 in 50 (Weil-Felix reaction). The titres of the second patient's serum for these suspensions were just within the limits, but the serum of Case 3 had definitely higher titres for the strains of *Proteus* OXK and OX19 derived from the National Collection of Type Cultures. Twelve sera submitted to the laboratory for the Wassermann test gave titres less than 1 in 25 for all the suspensions used.

The original source of the *Proteus* is a matter for speculation. There is no evidence to make one suspect that the cockles were contaminated on arrival at the vendor's premises. Cockles though often contaminated by sewage (Leighton, 1927), are able to grow well on clean, sandy areas. The outbreak was confined entirely to those who had partaken on the one evening only. The evidence suggests a contamination of the particular batch of cockles sold on September 11—some time during or subsequent to their preparation. The use of the final receptacle for personal ablution and the general uncleanness of the premises favour this possibility. Further, the fact that at least one individual who had partaken of the cockles had not suffered therefrom suggests that the contamination of the batch was not of even distribution, and so probably arose at a late stage of the preparation.

Thanks are due to Professor R. H. Parry for permission to publish the details and to Drs L. Roberts, C. D. Preston, J. T. C. Taylor and J. L. W. Davies and Chief Sanitary Inspector I. A. Robinson for supplying information and specimens and to Dr W. M. Scott for helpful criticism. Part of the expenses of the investigation was defrayed by a grant from the Colston Research Grants Committee.

GASTRO-ENTERITIS ASSOCIATED WITH
PROTEUS VULGARIS

BY

J D ALLAN GRAY, M.B., B.Sc., F.R.C.P. Ed.,
D.P.H.(From the Preventive Medicine Department University of
Bristol)

An outbreak of acute gastro-enteritis affecting at least eighteen individuals occurred in Avonmouth during the night of September 11, 1936. All the affected individuals had partaken of cockles sold by an itinerant vendor on the evening of that day, and only one person could be found who had eaten some of the cockles and who had not been ill. After an incubation period varying from three to six hours the illness commenced with headache, nausea, abdominal pain, vomiting, diarrhoea and prostration. There was no pyrexia. With the exception of two cases the individuals affected were not seriously ill and had practically recovered within twenty-four or forty-eight hours. There were no deaths. The two patients who were seriously ill recovered in seven to ten days.

Considerable difficulty was experienced in tracing the vendor of the cockles, but largely owing to the indefatigable efforts of the chief sanitary inspector aided by the police and interested patients he was finally traced. The vendor was in the habit of receiving seven or eight bags of cockles a week from South Wales. On their arrival at his premises his routine procedure was to steep the cockles overnight in water in a pan to which salt had been added. This removed the larger portion of the sand present. The following morning the cockles were placed in a bucket with a perforated bottom and lowered into water boiling in an ordinary washing copper. This reduced the temperature of the water but as soon as the water boiled again the bucket was removed, emptied and refilled and the process repeated. The heating loosened the cockles in their shells and allowed of their being riddled into either a small or large galvanized iron bath containing water and salt. The empty shells which remained in the sieve were discarded.

Close questioning elicited the fact that the vendor, his wife and family were in the habit of performing their personal ablutions in the larger of these two baths when it was not actually being used for the preparation of the cockles. In the process it will be seen, therefore, that the cockles were washed in three lots of water and that the only heat to which they were subjected was when they were brought to the boil—a procedure occupying at most about two or three minutes. Further, when the bath used for the personal washing of the vendor and his family was employed to hold the cockles the latter were not subsequently subjected to heat or otherwise cleaned before being sold.

The premises in which the cockles were thus prepared consisted of a small cellar nearly completely underground, ill ventilated, and containing an accumulation of litter and rubbish. Both floor and ceiling were defective and the walls were dirty. The vendor, his wife and family of six children all appeared healthy and had no symptoms relating to enteritis. He had carried out the business of selling cockles in different parts of Bristol and the surrounding villages for twelve years and up till now had not been questioned. Inquiries among practitioners of districts other than Avonmouth where the vendor had sold cockles failed to disclose the occurrence of any cases of enteritis which could in any way be attributed to him.

Bacteriological Findings

Owing to the rapidity with which most of the patients recovered only two samples of stools in the liquid state were obtainable. Vomits were not secured. Throughout the investigation all the faeces examined failed to show the presence of organisms of the enteric, dysentery, or food poisoning groups.

Case 1 (W.B.)—Faeces examined on September 14 by which time the patient had completely recovered, were hard and contained numerous atypical *B. coli*. *Proteus vulgaris* was not found.

Case 2 (C.W.)—The faeces on September 14 were still very diarrhoeic and contained *Proteus vulgaris* (motile spreading) and late lactose fermenting *B. coli*. A blood culture taken on September 18 was sterile. A serum test on September 18 in dilutions of 1 in 25, 1 in 50, 1 in 125 and 1 in 250 did not agglutinate the Standards Laboratory suspensions of *Bact. typhosum*, *H. Bact. typhosum*, *O. Bact. paratyphosum A*, *Bact. paratyphosum B*, *Bact. enteritidis* Gaertner, *Bact. aertrycke* (sp.), composite non-specific *Salmonella*, *Bact. newport* (sp.), *Bact. supestrifer* (para C) (sp.) and *Br. abortus*. The titres for various strains of *Proteus* are given in Table I.

TABLE I—Serum of Case 2

Strain of <i>Proteus</i>	Dilution of Serum			
	25	50	125	250
(1) HXK (Nat. Coll.)	++	±	—	—
(2) OXK	++	±	—	—
(3) HX2	++	+	—	—
(4) OX2	++	++	±	—
(5) OX19	++	+	±	—
(6) <i>Proteus mirabilis</i> (N.C.)	—	—	—	—
(7) OX19 (Standards)	++	+	—	—
(8) Case 2's strain	++	++	++	±
(9) Case 3's strain	++	++	++	±

++ = Complete agglutination
+ = Incomplete agglutination
± = Trace of agglutination

The first six strains were obtained from the National Collection of Type Cultures and the seventh from the Standards Laboratory at Oxford. At 1 in 25 and higher dilutions the serum did not agglutinate the atypical *B. coli* from Case 1 and the late lactose fermenting *B. coli* from his own faeces. In a further examination of the faeces on September 23 *Proteus vulgaris* and late lactose-fermenting *B. coli* were not found but streptococci and *Bact. aerogenes* were present. The serum findings on September 25 were identical with those of the sample obtained on September 18 except that the titre for the patient's own strain of *Proteus vulgaris* had fallen slightly, so that complete agglutination was obtained at 1 in 50 and incomplete at 1 in 125. Almost identical results were secured with the strain of *Proteus* isolated from the bath (see below).

Case 3 (E.W. wife of Case 2)—Faeces examined on September 14 gave a growth of *Proteus vulgaris* (motile spreading). A suspension of the organism was agglutinated by the sera of both Cases 2 and 3 up to but not beyond a dilution of 1 in 25. When fed to mice it had no ill effects. Her serum on September 18 gave reactions similar to those of her husband's serum (see Table II). A blood culture made on September 18 was sterile. From the faeces (September 23) typical *B. coli* only were obtained. In a serum test on September 25 no alterations in the titres of the suspensions of *Proteus*

GASTRO-ENTERITIS ASSOCIATED WITH
PROTEUS VULGARIS

BY

J D ALLAN GRAY, M.B., B.Sc., F.R.C.P. Ed.,
D.P.H.(From the Preventive Medicine Department University of
Bristol)

An outbreak of acute gastro-enteritis affecting at least eighteen individuals occurred in Avonmouth during the night of September 11, 1936. All the affected individuals had partaken of cockles sold by an itinerant vendor on the evening of that day, and only one person could be found who had eaten some of the cockles and who had not been ill. After an incubation period varying from three to six hours the illness commenced with headache, nausea, abdominal pain vomiting diarrhoea and prostration. There was no pyrexia. With the exception of two cases the individuals affected were not seriously ill and had practically recovered within twenty-four or forty-eight hours. There were no deaths. The two patients who were seriously ill recovered in seven to ten days.

Considerable difficulty was experienced in tracing the vendor of the cockles, but largely owing to the inde fatigable efforts of the chief sanitary inspector aided by the police and interested patients he was finally traced. The vendor was in the habit of receiving seven or eight bags of cockles a week from South Wales. On their arrival at his premises his routine procedure was to steep the cockles overnight in water in a pan to which salt had been added. This removed the larger portion of the sand present. The following morning the cockles were placed in a bucket with a perforated bottom and lowered into water boiling in an ordinary washing copper. This reduced the temperature of the water, but as soon as the water boiled again the bucket was removed emptied and refilled and the process repeated. The heating loosened the cockles in their shells and allowed of their being riddled into either a small or large galvanized iron bath containing water and salt. The empty shells which remained in the sieve were discarded.

Close questioning elicited the fact that the vendor his wife and family were in the habit of performing their personal ablutions in the larger of these two baths when it was not actually being used for the preparation of the cockles. In the process it will be seen therefore that the cockles were washed in three lots of water and that the only heat to which they were subjected was when they were brought to the boil—a procedure occupying at most about two or three minutes. Further when the bath was used for the personal washing of the vendor and his family was employed to hold the cockles the latter were not subsequently subjected to heat or otherwise cleaned before being sold.

The premises in which the cockles were thus prepared consisted of a small cellar nearly completely underground ill ventilated, and containing an accumulation of litter and rubbish. Both floor and ceiling were defective and the walls were dirty. The vendor his wife and family of six children all appeared healthy and had no symptoms relating to enteritis. He had carried out the business of selling cockles in different parts of Bristol and the surrounding villages for twelve years, and up till now had not been questioned. Inquiries among practitioners of districts other than Avonmouth where the vendor had sold cockles failed to disclose the occurrence of any cases of enteritis which could in any way be attributed to him.

Bacteriological Findings

Owing to the rapidity with which most of the patients recovered only two samples of stools in the liquid state were obtainable. Vomits were not secured. Throughout the investigation all the faeces examined failed to show the presence of organisms of the enteric, dysentery, or food-poisoning groups.

Case 1 (W.B.)—Faeces examined on September 14 by which time the patient had completely recovered were hard and contained numerous atypical *B. coli*. *Proteus vulgaris* was not found.

Case 2 (C.W.)—The faeces on September 14 were still very diarrhoeic and contained *Proteus vulgaris* (motile spreading) and late lactose fermenting *B. coli*. A blood culture taken on September 18 was sterile. A serum test on September 18 in dilutions of 1 in 25, 1 in 50, 1 in 125 and 1 in 250 did not agglutinate the Standards Laboratory suspensions of *Bact. typhosum* H, *Bact. typhosum* O, *Bact. paratyphosum* A, *Bact. paratyphosum* B, *Bact. enteridis* Gaertner, *Bact. aertrycke* (sp.), composite non specific *Salmonella*, *Bact. newport* (sp.), *Bact. suispestifer* (para C) (sp.), and *Br. abortus*. The titres for various strains of *Proteus* are given in Table I.

++ = Complete agglutination
+ = Incomplete agglutination
± = Trace of agglutination

The first six strains were obtained from the National Collection of Type Cultures and the seventh from the Standards Laboratory at Oxford. At 1 in 25 and higher dilutions the serum did not agglutinate the atypical *B. coli* from Case 1 and the late lactose fermenting *B. coli* from his own faeces. In a further examination of the faeces on September 23 *Proteus vulgaris* and late lactose fermenting *B. coli* were not found but streptococci and *Bact. aerogenes* were present. The serum findings on September 25 were identical with those of the sample obtained on September 18 except that the titre for the patient's own strain of *Proteus vulgaris* had fallen slightly, so that complete agglutination was obtained at 1 in 50 and incomplete at 1 in 125. Almost identical results were secured with the strain of *Proteus* isolated from the bath (see below).

Case 3 (E.W. wife of Case 2)—Faeces examined on September 14 gave a growth of *Proteus vulgaris* (motile spreading). A suspension of the organism was agglutinated by the sera of both Cases 2 and 3 up to but not beyond a dilution of 1 in 25. When fed to mice it had no ill effects. Her serum on September 18 gave reactions similar to those of her husband's serum (see Table II). A blood culture made on September 18 was sterile. From the faeces (September 23) typical *B. coli* only were obtained. In a serum test on September 25 no alterations in the titres of the suspensions of *Proteus*

vulgaris were found and the serum still failed to agglutinate the Standards Laboratory suspensions of enteric and food poisoning organisms

Unfortunately samples of cockles were not obtainable for examination either at the houses of the affected patients or on the premises of the vendor. All the vessels used by the vendor in the preparation of the cockles were therefore rinsed with sterile saline, and the resulting rinsings as well as a sack in which the cockles had been delivered, were examined, without success for organisms of the food poisoning, enteric, and dysentery groups. *Proteus vulgaris* (motile spreading) was found in considerable numbers in the bath which had been used for the ablutions of the vendor and his family before and after the final rinsings of the cockles. The organism was

TABLE II—Serum of Case 3

(9) Case 3's strain	±	++	++	—

++ = Complete agglutination.
+ = Incomplete agglutination.
± = Trace of agglutination

not found in the washings from any of the other vessels or in the sack. The strain of *Proteus* was agglutinated by the sera from Cases 2 and 3 (see above)

"All three strains of *Proteus* isolated—that is, from the faeces of the second and third cases and from the bath—liquefied gelatin produced indole and gave identical sugar reactions. Thus all failed to ferment lactose, dulcitol, and mannite and all produced acid and gas in glucose saccharose maltose and salicin

Samples of faeces, blood for blood culture and sera for agglutination were obtained from both the vendor and his wife on September 22. Neither of the faeces yielded *Proteus vulgaris* or other pathogenic organisms although that of the woman contained some late lactose fermenting *B. coli*. The blood cultures were both sterile and the sera in dilutions of 1 in 25 and higher both failed to agglutinate any of the suspensions of *Proteus vulgaris* or any of the Standards Laboratory's suspensions of enteric or food poisoning organisms

Discussion

Previous outbreaks of food poisoning for which *Proteus vulgaris* has been held responsible have been recorded by Glücksmann (1899), Silberschmidt (1899), Pfuhl (1900), Demnitz (1926) and Wilson (1929). Usually, however the evidence has not been convincing and it is to be noted that the majority of these were reported prior to the obtaining of the more exact knowledge held to day of the *Salmonella* group. In the case recorded by Demnitz, however the agglutination of the *Proteus* suspension by the patient's serum at a dilution of 1 in 400 considerably strengthened the evidence for attributing the patient's diarrhoea to that organism

In the investigation of epidemics of acute gastro enteritis not due to the ingestion of food in itself inherently poisonous or contaminated with a chemical poison, considerable caution must be exercised in attributing responsibility for the outbreak to any organism other than staphylococci or members of the *Salmonella* group. This is especially true when a *Proteus* is suspected, for, as Savage (1929) has written, "The evidence that organisms like *B. coli*, *B. proteus* or Morgan's bacillus can cause food poisoning is slender, and although many outbreaks have been attributed to them critical investigation does not substantiate the association. Benington (1919) held a similar view. It is on account of the rarity of cases of food poisoning justifiably regarded as due to *Proteus vulgaris* as well as on account of the hygienic lessons to be learned that this outbreak is here recorded

It is suggested that the evidence given is sufficient to incriminate *Proteus vulgaris* as the cause of the outbreak. Admittedly the organism may be present though never in large numbers, in the stools of normal individuals and enteric patients (see Wilson, 1929), and the secretion of inflamed surfaces such as enteric and dysenteric ulcers appears to offer a suitable pabulum for its development. It is conceivable therefore, that the *Proteus* found was an invader secondary to another organism, but the interval for such a sequence of events seems to be unduly short. Further, the serological reactions of Cases 2 and 3 suggest an aetiological significance not only on account of the titre (125 in each case), but also on account of the fall in titre in the second patient from 125 to 50 in one week.

According to a pamphlet issued in June, 1936, by the Standards Laboratory the limit of normal agglutination for the strains of *Proteus* OX19, OXK and OX2 is 1 in 50 (Weil Felix reaction). The titres of the second patient's serum for these suspensions were just within the limits, but the serum of Case 3 had definitely higher titres for the strains of *Proteus* OXK and OX19 derived from the National Collection of Type Cultures. Twelve sera submitted to the laboratory for the Wassermann test gave titres less than 1 in 25 for all the suspensions used

The original source of the *Proteus* is a matter for speculation. There is no evidence to make one suspect that the cockles were contaminated on arrival at the vendor's premises. Cockles, though often contaminated by sewage (Leighton, 1927) are able to grow well on clean, sandy areas. The outbreak was confined entirely to those who had partaken on the one evening only. The evidence suggests a contamination of the particular batch of cockles sold on September 11—some time during or subsequent to their preparation. The use of the final receptacle for personal ablution and the general uncleanness of the premises favour this possibility. Further, the fact that at least one individual who had partaken of the cockles had not suffered therefrom suggests that the contamination of the batch was not of even distribution, and so probably arose at a late stage of the preparation

Thanks are due to Professor R. H. Parry for permission to publish the details, and to Drs. L. Roberts, C. D. Preston, J. T. C. Taylor and J. L. W. Davies and Chief Sanitary Inspector J. A. Robinson for supplying information and specimens and to Dr. W. M. Scott for helpful criticism. Part of the expenses of the investigation was defrayed by a grant from the Colston Research Grants Committee

Clinical Memoranda

Paget's Bone Disease in Three Sisters

The exact nature and aetiology of osteitis deformans (Paget's bone disease) are still unknown. The disease is certainly not of syphilitic origin, as was maintained by Lannelongue (1903) and some other French writers, though in rare cases of inherited syphilis in children it may be superficially imitated in a very striking manner, as one of us (F P W, 1908), amongst others, has pointed out.

That at least the liability to the disease may be inherited is illustrated by the family under our present consideration in which three sisters commenced to suffer from typical osteitis deformans in the second half of their lives whilst their nine brothers are said not to have been affected. S Maynard Smith (1905) recorded the case of a man, aged 42 years, who had Paget's disease of three years' duration and whose father, aged 74 years, had had Paget's disease for thirty-five years. The disease therefore commenced both in the father and the son at about 39 years of age. A Chauffard (1894) mentioned a woman, aged 80 years and her daughter, aged 60 years, both of whom suffered from typical Paget's disease and were likewise somewhat mentally unsound. Berger (1903) spoke of an old lady with typical Paget's disease whose son, aged 35 years, had Paget's disease of the tibiae of some years' duration. Dr E A Cockayne tells me that he was recently shown a woman with severe osteitis deformans whose father according to the patient's description had obviously suffered from the same disease. Dr Cockayne says he is sure there have been reports published of two sibs suffering from Paget's disease and he thinks that mere coincidence can hardly account for the family under consideration with three sisters suffering from so uncommon a disease. In fact, either Paget's disease itself or some special liability to it must be inherited.

THE PRESENT FAMILY

A married woman, aged 66 years, was admitted to hospital in March, 1937, saying that for the last four months or so she had noticed a gradually increasing enlargement of the upper part of her skull, more marked on the left side. The patient had enjoyed good health and did not actually feel ill. Radiographs of the skull showed the changes typical of Paget's disease. On further examination of the patient nothing else abnormal was found excepting a radiographic appearance of the ischial bones suggesting slight osteitis deformans there also. Blood serum gave negative Wassermann and both Meinel reactions. Blood serum calcium 10.4 mg per cent.

The patient's eldest sister, born about 1860, is living and healthy according to the patient, excepting that for the last eleven years her shins have been thickened and bent. In August 1927 this sister was an out-patient at the German Hospital under Dr F J Jauch, and radiographs of her skull and right tibia were taken. The radiologist, Dr E J H Roth, reported that the skull and the right tibia showed changes characteristic of Paget's disease.

The patient's only other sister who was born about 1867 and died about 1929 had very decided enlargement of the upper part of her skull for the last few years of her life.

These three sisters had nine brothers none of whom are known to have been affected with Paget's disease.

Mental Disturbance following Atropine Administration

The case of psychosis associated with atropine administration reported by Drs F Hopkins and J Robyns Jones in the *Journal* of March 27 (p 663) recalls a somewhat similar case which recently came under my notice.

CASE REPORT

A boy aged 10 years was sent by the school medical inspector to the County and City Infirmary, Waterford, to be treated for a convergent strabismus. I decided to prescribe glasses. Three drops of a 1 per cent solution of atropine sulphate were instilled in each eye as a cycloplegic to ascertain the refraction. Half an hour later the nurse in attendance inspected the boy's eyes when the pupils were found to be semi-dilated. Some additional atropine was instilled making the total quantity received approximately five drops in each eye. At the same time the boy's behaviour began to attract attention. It was noticed that his gait had become unsteady and that he had considerable difficulty in walking. He was restless and seemed very frightened. He screamed and said he saw a child beside him and tried to catch hold of this imaginary child. In reply to questions concerning the boy's history his mother who accompanied him, definitely assured me that there had never previously been any mental disturbance. He was kept under observation but as his condition did not improve it was decided to admit him as an inpatient. Directly after admission (1.30 p.m.) he was put to bed. He was confused and did not know where he was or what had happened to him. He thought that there were other children annoying him. At 3.30 p.m. a bed-bath was given. He then became violent and attempted to strike the nurses. Later he became calmer and seemed to lapse into a state of coma. He refused to take any food. At about 7 p.m. he became very restless and made several attempts to leave his bed. He now became so violent that it was necessary to summon one of the medical staff. Dr M Shipsey, who has very kindly given me a report on the boy's condition. He states: "I saw the patient at about 7 p.m. He was then in a wildly delirious state, screaming, and tearing his bedclothes. Three nurses were holding him down. He attacked me with his fists and legs and attempted to bite me. With difficulty morphine 1/6 grain was given and after an interval of twenty minutes he became calmer and within an hour was asleep. He was restless during the night. The next day the boy's behaviour was perfectly normal but he did not remember what had happened on the previous night. The remainder of his stay in hospital was uneventful and he was discharged on the third day after the date of admission."

It would seem reasonable to assume that in this case there was an atropine idiosyncrasy although a confirmatory injection of this drug was not given. Cases of this kind are comparatively rare and I think this experience is worthy of being recorded. I desire to express my indebtedness to Dr M Shipsey for his kind co-operation.

DEPOPULATION

The Menace of British Depopulation By G F McCleary
M D (Pp 148 4s 6d net) London G Allen and
Unwin 1937

If the public is indifferent to the lessons of vital statistics, it is not for want of teachers. Dr G F McCleary's book adds little, if anything to readily available demographic knowledge, but was worth writing because it is informed with a wisdom which ought to inform the writings of an experienced physician and is usually absent from popular treatises on the trend of population. Some authors, more familiar with West End clubs than East End slums denounce the selfishness and lack of patriotism of their neighbours. Others ride economic hobby horses and denounce the Government. All denounce somebody or something. Dr McCleary denounces nobody and has no panacea. He summarizes the facts. The reason for popular indifference could hardly be better expressed than in these sentences:

Nothing will happen to lead people to think that anything important is going on. The spectacle of a queue of workless men waiting to draw unemployment benefit heated discussions of the means test—the receipt of shoals of applications for vacant situations—such things influence public opinion and naturally support the belief that there are too many people in the country. In the early stages of depopulation nothing will happen to upset that belief. There will be no spectacles or discussions suggesting to the ordinary citizen that there are going to be too few people in the country. He may note the appearance in the Press and elsewhere of attempts to convey a warning against depopulation but if he does he will probably be inclined to regard them as the productions of people making a fuss about nothing."

Dr McCleary reviews the economic incentives to produce larger families which have been tried, but is sceptical of their success. It is indeed obvious that none of them even professes to do more than slightly reduce the economic handicap of a family. He estimates that the French system of family allowances in 1932 increased the income of an unskilled worker with four dependent children by from 15 to 20 per cent. If this means, as we presume it does, that a family of six will have one-fifth more money to spend than a family of two (or one) the economic incentive is derisory. Dr McCleary does indeed hold that a more copious and equal distribution of wealth is essential but that 'the problem of depopulation is one not of economics but of spiritual values. We have to deal with a society that has lost, not indeed the power but the will to survive. In other words, we need a new gospel. It may be that the immense power of mass suggestion used to convince whole nations that it is their duty to hate and if possible destroy or subjugate other nations may persuade the citizens not merely to die but to procreate for their national idol. But that is not exactly a message of good tidings. No other psychological incentive has been tried. Dr McCleary does not profess to have a solution. What he has done is to describe the position clearly and fairly. We must await the gospel without much hope that it will be delivered by the next the next but one or the nth Departmental Committee or Royal Commission which will be appointed during this generation.

It is an ominous thought that in the age of Augustus when the shadow of depopulation was beginning to fall across the path of empire not only were there legislative

encouragements of parenthood but a poet, whose influence over the feelings of his countrymen has never been equalled, devoted to the praise of that way of life which is most associated with the ideal of large families, to the lives of peasants, a eulogy of which almost every line is even now a "rig". It had no effect, although one of the recommendations—

At securā quies et nescia fallere vita

was almost true. It is no longer true of any way of life, and that is perhaps the insuperable obstacle to a change of ideal. Without a sense of security little can be expected.

PHYSICAL MEDICINE APPLIED TO OTOLARYNGOLOGY

Physical Therapeutic Methods in Otolaryngology By
Abraham R. Hollender M D F A C S (Pp 442
189 figures 21s net) London H Kington 1937

A general account of the services which physical medicine can render to the practice of otolaryngology is provided in this work by eleven authors under the editorial supervision of Dr Abraham Hollender. The various points of view traverse such a wide field, and arrive at an interpretation of physical therapeutics from such widely different aspects that it is not easy to give a short and comprehensive description of the contents but in so far as the articles are confined to the use of electricity and the various forms of radiation in treatment the book will be found to contain a large amount of well-arranged and well-documented information. It begins with a dissertation on elementary physics a useful reminder of the methods by which electrical currents are produced and the laws which govern them. Next comes a full description of diathermy in all its forms and of electro-surgery. This is followed by a similar full description of radiation in general and in separate detail of phototherapy, ultra-violet irradiation, and of x rays and radium.

It is a striking feature of the book that the authors are not carried away by an over zealous enthusiasm for the methods described, and where these have proved of doubtful benefit or the older simple methods of treatment, either medical or surgical are superior there is no hesitation in saying so. We thus have an assurance that no unworthy claims are being put forward, and that the statements made are correct in substance as well as in the letter. This applies especially to Part II of the book, which deals with the actual application of physical agents in otolaryngology, and a good example is provided by the chapter on ionization in vasomotor rhinitis. It is emphasized that benefit is obtained at the expense of permanent destruction of the ciliated epithelium of the nose and this is clearly demonstrated in a series of photomicrographs. In this part the chapter on laryngeal tuberculosis, which in itself is remarkably good, seems scarcely apposite since treatment is by the electrocautery. The same applies to the later article by Dr Chevalier Jackson on the endoscopic approach to therapy, really a brief description of endoscopic methods.

The treatment of acute rhinitis and of sinusitis, both acute and chronic, perhaps shows the book at its best for the indications and contraindications and the danger of applying physical methods to undrained collections of pus are clearly stated. There is naturally some want of uniformity in a collection of articles by various writers but the book will be found to contain a reasonable statement of a new branch of medicine—a branch subject to continual change and improvement, one whose possibilities the majority of specialists in otology and laryngology still neither fully appreciate nor understand.

DETACHMENT OF THE RETINA

Le D  collement de la R  tine et son Traitement By F Terrien Prosper Veil and M A Dollfus (Pp 164 45 figures 4 coloured plates 40 fr) Paris Masson et Cc 1936

Publications on the operative treatment of detached retina threaten to come in almost as constant a stream as those on colour vision and on squint—the two King Charles's heads of ophthalmology. Following the classical volume by Gonin, French literature has now been enriched by this monograph on detachment of the retina and its treatment, by Terrien, Veil and Dollfus. The authors justify their contribution as representing their personal experiences at the H  tel-Dieu during the past five years. The book is a satisfactory and balanced exposition on the subject and it is not the authors' fault that no final conclusions emerge. It would be too much to expect this when they find themselves compelled to discuss no fewer than thirteen different operative procedures. The subject, though of great and practical importance is yet in too fluid a state to allow dogmatism. Whether it is a sign of strength or weakness in this monograph that no definite teaching emerges from it must be a matter for justifiable difference of opinion, though a little more definite guidance as to the relative value of the different methods would not have been out of place. As a clear account of the present technique of operation the book can be recommended for it is an authoritative guide. The absence of an index is a defect which it shares with most French medical publications but the absence of any references is an incongruity in a work of this kind.

BEDSIDE EXAMINATION

Physical Diagnosis By Ralph H Major MD (Pp 457 427 figures 21s net) Philadelphia and London: W B Saunders Co 1937

The classical methods of physical diagnosis as an important factor in the clinical examination of the patient have during recent years been subject to the competition of instrumental and laboratory developments and at times enthusiasts for the new services have been inclined to disparage the older order. It is a useful enterprise to recall attention to the patient as the central factor in the clinical problem and to show that bedside examination continues to claim a large share of the physician's attention and judgement. In his *Physical Diagnosis* Professor Ralph H Major undertakes this enterprise and his teaching is both pleasantly and effectively presented. While he quotes mainly his own experience he is anxious to pay due regard to previous workers in the same field and he commends many of the original descriptions by authors now recognized as of classical authority. He endorses Osler's advice. Read the original descriptions of the masters who with crude methods of study saw so clearly. Influenced by this pious regard for his medical heroes, and strongly convinced both of the value of systematic physical examination and of a modern tendency to neglect these, Professor Major has produced a book which is both readable and serviceable and which while paying tribute to the ancient learning does not fail to give a place to modern values. He sticks to his text throughout, and applies it to the various regions of the body with a confident judgement. As an illustration of his claim for system and order in physical examination he is inclined to forbid the student even the possession of a stethoscope until inspection, palpation and percussion have been cultivated for a period of six months.

Altogether the book is justified as an assertion of the value of methods which need training and patience to

make them effective and which are perhaps apt in an age of hurry to suffer by comparison with more dramatic proposals. The ancient ways are fortunate in having an advocate so informed and so persuasive as Professor Major. The illustrations in his pages number 427 and while some of them are rather trivial many have high teaching value.

THE PSYCHOLOGIST AS DETECTIVE

The Unknown Murderer By Theodor Reik. Translated from the German by Katherine Jones (Pp 260 12s 6d net) London Hogarth Press, 1936

Psycho-analytical literature has dealt with the prevention of crime and its therapy with punishment and with the reform of penal law. All these studies presume that the criminal is known, psychology cannot deal with an unknown criminal. In finding out who did the murder the detective uses, and must use, material clues such as finger-prints, burnt match-sticks and weapons, and the deductions which he makes from them are a psychological process, of interest to the psychoanalyst. An equally important method of discovering the culprit however is to look for the motive and here the psychoanalyst claims that he can give vital assistance to the policeman. The author ranges widely in his disquisition on the psychology of criminals, detectives and judges but a careful perusal of the book will not enable the ordinary reader to discover any single idea or line of inquiry which binds the whole together. It is essentially a miscellaneous collection of entertaining reflections, some of which are psycho-analytical and some not obviously even psychological. It may be that the trained psychoanalyst will detect the unknown motive of the author where the ordinary reader will fall back perplexed. At all events the translation is capably done, and the translator has fulfilled her most difficult task—that of preventing her prose from suggesting a German original.

THE TIME OF OVULATION

Time of Ovulation in Women. A Study on the Fertile Period in the Menstrual Cycle By Carl G Hartman (Pp 226 72 figures, 13s 6d) London Bailliere Tindall and Cox 1936

The American National Committee on Maternal Health has included this monograph in its series. It is difficult to believe that the author seriously intended this book for medical practitioners, for if so it would hardly be necessary to talk about the egg tube and 'travels of the fertilized egg' or to describe in detail what the kymograph is. It should further be unnecessary to describe the elementary anatomy of the male and female generative organs. It is apparent that the main purpose of the book is propaganda in favour of the safe period popularized by Knaus and Ogino although valuable and interesting information is presented and a useful bibliography is appended. All the evidence which conflicts with the thesis is waved aside in the most airy manner. If the reader looks for a dispassionate debate concerning matters which are with difficulty kept clear of the bias of emotion and the restriction of convention—as he is promised by Dr R L Dickinson in the introduction—he will be disappointed. Were it not for frequent reference to his beloved monkeys it would not be credible that the author was eminent in the field of sex physiology.

The monograph is well worth reading not only because it contains information otherwise difficult to acquire but because it shows how relatively easy it is to be scientific with monkeys and rats and how difficult it is rightly to appraise the vast amount of clinical data which have accumulated.

Notes on Books

A second edition of Mr CHARLES F M SAINT'S *Surgical Note Taking A Booklet for Surgical Dressers and Clerks Commencing Clinical Studies* has been published by H K Lewis and Co (price 3s). A short introduction, dealing mainly with dressing note taking and case investigations to be carried out by the dresser, is followed by some twenty sections each of which is referred to as a scheme and deals with the special features of some clinical condition or group of conditions—for example 'Abdominal emergencies' (scheme V), 'Diseases of the genito urinary tract' (scheme XI), 'Jaundice' (scheme XX). Examples of cases are given with the various schemes. The system of making notes is one which was in use at the Royal Victoria Infirmary Newcastle-on-Tyne but with minor variations it may be made to fall into line with those employed in most teaching hospitals. The author points out in a foreword that for the student beginning clinical work it is understood that the various sheets will be briefly explained to him by his surgical teacher but even so the work in our opinion appears rather too tabulated to make interesting and easy reading. It should prove a useful guide, of a skeletal character to both teacher and student but in a future edition we suggest that the section on some general considerations could be profitably expanded.

A complete summary of present knowledge of complement would be of great value. Such a summary has been attempted by Dr T N B OSBORN in a book entitled *Complement or Alexin* (H. Milford, 7s 6d). He has covered a very wide range of investigation but there are some obvious omissions. For example no mention is made of the work of Dean and of Goldsworthy on the relation of complement-fixation to the ratio of antibody to antigen nor is the curious but theoretically important fact mentioned that complement is not fixed in the reaction between horse anti pneumococcal sera and the specific polysaccharides. The compilation is also somewhat uncritical. The expression 'albumin fraction' meaning the supernatant fluid after precipitation of euglobulin from serum is used without comment the author even speaks of 'the separation of albumin from globulin by dilution with distilled water'. He also states that 'it has never been observed that a mixture of toxin and antitoxin fixes complement *in vitro*'. The unsatisfactory evidence that some form of digestion accompanies the action of complement might have been considered in more detail.

Professor MARCEL METZGER has written a book entitled *Le Chirurgien Devant l'État Puerperal Grossesse Accouchement Suites de Couches* (Masson et Cie 52 fr). It deals with the early and differential diagnosis of pregnancy with ectopic gestation hydatidiform mole abortions tears associated with childbirth, and with injuries to the child. In many instances the views of the author differ widely from those current in this country. Chronic endometritis is held to be a common cause of miscarriage. In the preparation of a patient for removing an ovum it is directed that the buttocks and thighs as far as the knees should be painted with iodine but neither the vagina nor the cervix is to be treated with any antiseptic, yet the author recommends that the urethral orifice should be painted with iodine before a catheter is passed. It is laid down that tears of the vagina occurring during childbirth do not require suture—and it is apparently necessary to advocate that perineal tears should be sutured. Professor Hartman in the preface states how useful the book should be in France where so often the obstetrician is considered to be incapable of any surgical intervention. The advice tendered

however would appear to be too vague to be of much service to a surgeon who is unfamiliar with the emergencies described, and it is unlikely that the book will make any appeal in this country.

We have received a copy of the *Proceedings*, compiled by Dr Edgard de Cerqueira Falcao, of the congress held on September 5 and 6, 1936 at Santos, Brazil, on the occasion of the centenary of the foundation of the Hospital da Santa Casa da Misericórdia de Santos. The subjects discussed included tuberculosis, ophthalmology, otorhino laryngology, dermatology and venereal diseases, hospital assistance, and obstetrics.

Preparations and Appliances

A VENEPUNCTURE INSTRUMENT

Dr DAVID A HERO (Liverpool) writes

Venepuncture in children frequently presents difficulties such as (1) movement of the limb by the nervous child (2) the tendency to exert too much vacuum in the syringe and thus pull on one's hand which dislodges the needle from the lumen of the vein. To obviate these defects I have designed the device shown in the accompanying figure which is entirely self-contained the suction mechanism being controlled by a ratchet and spring catch.

The device is only seven inches long and is constructed to take a 10 ccm Record syringe. It is operated by releasing the catch (by the index finger of the same hand which holds the device) the other being free to hold the arm or milk the vein if required. The advantage over other suction devices is that a varying vacuum can be obtained to suit individual cases thus the full tension of the spring can be employed or only fractions of it.

This device has been made for me by Messrs Down Bros., Ltd. London.

A MULTIPLE TUBE SEDIMENTOMETER

Dr J W SHACKLE and Dr C L ESTRANGE ORME write

For the past year we have been using a simple form of apparatus for recording sedimentation rates graphically. The large number of cases on which this test had to be carried out, coupled with the irregular and late hours at which the specimens arrived at the laboratory made it necessary to devise an apparatus capable of making a graphic record of a number of tests and sufficiently trustworthy to be able to carry out such tests automatically after the laboratory was closed.

The apparatus is designed to take up to eight full sized Westergren tubes but is easily adaptable to take up to twice that number if desired, or to take any other type of tube used for estimating the sedimentation rate. The Westergren technique was adopted as being that in the most common use for rheumatic cases and the graphs are plotted up to the end of two hours this period being in our experience essential. The results are usually reported in the form of the distance sedimented at the end of one and two hours. The apparatus has been devised to allow tubes to be added to the rack for two hours after the mechanism has been started such addi-

tions are easily made as the apparatus can be used in the open laboratory if not in the direct light from a window.

A standard Westergren tube rack is set up and arranged to run laterally on rollers. These are grooved and run on small rails. The tubes in it are illuminated obliquely from behind by means of a 30-watt strip light (E) such as those used for window or show-case illumination which is the same length as the tube rack. At the top of the rack a mirror is fitted (F) which is also the same width as the rack. The angle of this is adjusted to illuminate the upper ends of the columns of blood. A black background is contrived by means of the black velvet-covered screens (H and I). These are inclined at the angle shown partly in order that no light shall be reflected from their surfaces and partly in order that the screen H in conjunction with the glass screen (G) attached to the tube rack and travelling with it shall deflect warm air away from the Westergren tubes to avoid any possibility of error from heating of the tubes. The mirror and lamp are screened from the camera by the blackened wood screens (Q and R) attached to the uprights of the tube rack. The rack is propelled along the rails by the clock (J). This in our apparatus is a spring clock, the drive being taken from the intermediate pinion between that of the hour and minute hands. In parts of London where alternating current is available an electric clock would be more convenient. At the end of the set time the current is switched off by a mercury tube switch. The camera shutter is also closed and the clock stopped automatically.

The recording is done by means of a camera (A). This is a half plate camera with a lens (C) of 6½-inch focus on a sliding base as we use larger magnifications on individual tubes for research purposes. For the standard technique a fixed focus box camera will do. The half plate dark slide contains a cut film holder in which a sheet of bromide paper (contrast) is placed. Some care is needed in adjusting the light and finding the correct iris opening: the lamp must be rotated in the trough shaped reflector and the mirror (F) adjusted till the maximum light is cast on the blood columns. This is of great importance as the essential feature of the

to continue adding tubes to the rack for two hours after starting the clock and yet obtain at least a two-hour reading on all of them.

As the tube moves a known distance of 6 mm and the millimetre calibrations of the tubes appear on the chart it is easily possible with a divider to measure the equivalent of an hour on the chart without estimating the magnification to do so. Such measurements are only required for the larger

FIG 2—Readings are made by a ruled celluloid scale as described in the text superimposed on each recording in turn and the scale is represented diagrammatically by the line marked hours.

magnifications used for research purposes. For standard technique it is simpler to prepare a celluloid protractor with hour and millimetre rulings to scale on it. Readings at any time interval required can then be obtained at a glance.

It is possible that clinicians in the future will desire to see the actual curve and not a few time readings taken from it. There is no doubt that the form of curve is of considerable importance.

Fig 2 represents a record of tubes from such a standard test (Tubes numbered 1-7). No 3 is from a long-standing case of rheumatoid arthritis with many joints involved. The rate has been over 60 mm in the first hour for two years. The double curvature is quite typical. No 4 gives a rate of 47 mm for the first hour 88 mm for the second hour—a more moderate reading from a case of infective arthritis with improvement under treatment. Nos 1, 5 and 7 are from early cases of infective arthritis. No 6 is from a case of rheumatoid arthritis with an eight years history but the disease is limited to hands. No 2 is a normal reading.

It was noted that in many of the readings a second curve could be seen at the top of the tube. This shows the sedimentation of the opalescent bodies in the serum. This curve bears no relation to the blood sedimentation curve although showing minor variations from case to case thus suggesting that the sedimentation of the blood cells is rather more than a merely physical settling out by gravity. This secondary sedimentation had not been noted until photographic readings by oblique light were studied and it may be that the method as well as being a great convenience in a busy laboratory may also yield further light on the nature of the variations which occur in suspension stability. (We have approached Messrs Hawksley of New Cavendish Street with a view to manufacture.)

COLLOSOL PHOSPHO-MANDELATE

The Crookes Laboratories have produced a new pack for their collosol brand phospho-mandelate. This preparation is now put up in boxes containing two bottles, one with ammonium phosphate and the other with mandelic acid. Each pack contains a supply sufficient for six days' treatment. Further details may be obtained from the Crookes Laboratories, Park Royal, London, N.W.10.

FIG 1—Diagrammatic representation of the multiple tube sedimentometer.

method is that the plasma left when the red cells sediment is opalescent to oblique light and thus shows up as a luminous object which records on the photographic paper as a black image while the red cell columns are non-actinic. In our rack the tubes are placed 25 mm apart and the rack moves 6 mm an hour. In this fashion it is possible to get readings for four hours without the images overlapping or it is possible

BRITISH MEDICAL JOURNAL

LONDON

SATURDAY MAY 1 1937

DIFFICULT MIDWIFERY

A book of 440 pages was published in 1894 by G E Herman, obstetric physician to the London Hospital entitled *Difficult Labour*. In this small compass the author assembled the reflections and conclusions drawn by an acute mind from an unusually spacious experience as a teacher and a practitioner of midwifery. Proffered with the object of assisting practitioners and senior students it completely achieved its purpose and earned a well-merited popularity. Many now senior men would acknowledge the debt they owe to Herman's teaching. The illustrations in the manner of the period, were inartistic and poorly executed, consequently they did not distract attention from the text, which was so closely packed with fact and inference as to demand a definite effort of concentration on the part of the reader. The approach of the obstetric author of to-day to this subject is very different from that of Herman. The modern equivalents are four or five times the size of his book, their illustrations are drawn by artists who specialize in this class of work and they undoubtedly form an important factor in market valuation. We have admirable English representatives of this class but the Americans are our keen competitors, and the latest arrival from the "other side" by Dr Paul Titus of Pittsburg, may be said to go one better than its predecessors¹. It is a large and handsomely illustrated book of reference which any obstetrician might be glad to carry on his shelves.

Allowance must be made for the fact that the modern obstetric textbook dealing with difficulties emergencies and operations covers a good deal more ground than was thought to be necessary before midwifery harnessed its wagon to the star of surgery. It must also be remembered that to-day volubility, not conciseness, is the cult to which writers in practically all departments of medicine pay tribute. The fact remains however that obstetric teachers appear to be more concerned than ever before to emphasize the existence of obstetric difficulties and the importance of their proper management. Comparison of the contents tables of the old and the new show that no difficulties

occur to-day which were not known to Herman and his predecessors, but evidence is lacking that recent advances in obstetric practice have brought about any marked diminution in their frequency. Attention has often been called to the discouraging fact that ante-natal supervision, widely though it has been organized, has not resulted in any appreciable fall in the incidence of difficult labour. Great hopes were entertained by Ballantyne and other pioneers of ante-natal work that early recognition of conditions likely to cause difficulty in the birth process would be followed by a lessened incidence of difficult labour, and would thus come to play an important part in prevention. The failure of these hopes must be attributed to inefficiency either in the system itself or in its personnel. There is no more urgent problem in midwifery at the present time than that of extracting from our widespread and expensive ante-natal organization the results which it may reasonably be expected to yield but which have not yet materialized.

Many cases of difficulty arising during labour are admitted as "emergency cases" to our lying-in hospitals. A study of these admissions suggests that the quality of obstetric judgement is an endowment not bestowed upon all who practise midwifery. Slow dilatation appears in many instances to have exhausted not so much the strength of the patient as the patience of the doctor, in consequence forceps were applied before there was room for the head to pass through the cervix, the attempts to deliver being abandoned the woman was sent to hospital as a case of "failed forceps". When in such circumstances the judgement of the practitioner is completely at fault the head may be dragged through imperfectly dilated passages and serious injuries thereby inflicted. These are examples of difficulty created by unwise management. Since Herman's time the management of delay in the stage of dilatation has been so greatly simplified that this condition need no longer be regarded with anxiety. Methods of obstetric analgesia which have been progressively improved in recent years may be said to have reached their full development in the demonstration that the administration of nitrous-oxide gas and air by means of Minnitt's apparatus is devoid of risk and can be continuously employed for long periods and its technique can be readily learned.

It must be admitted that the management of inertia is the only example of definite progress in the control of difficulty in labour which can be recorded. The tendency apparent to-day is not to prevent difficulty by anticipation, or to surmount it by skilful management but to evade it by taking the surgical short-cut of Caesarean section. In con-

¹ *The Management of Obstetric Difficulties* By Paul Titus M D
11 Kimpton (36s)

firmation we may point to the long and still growing list of "relative" indications for Caesarean section, many of which are unassociated with risks of obstruction but are nevertheless potential causes of difficulty in labour. Herman's list of relative indications was very short. He regarded delivery by craniotomy as involving a lower maternal risk than Caesarean section; this would not now be conceded by obstetricians, nor would it be regarded as good midwifery to sacrifice a living foetus unless the alternative of Caesarean section would be attended by maternal risks far above the average.

Difficult labour is admittedly a severe test not only of the strength and fortitude of the mother but also of the skill and judgement of the practitioner. It is comparatively easy to provide all the assistance the mother may need when the likelihood of difficulty has been foreseen or its presence has received early recognition in labour. Skill and judgement in the medical practitioner are therefore the dominant requirements; the former is to be gained only by training and experience, the latter is to some extent a natural endowment springing from an aptitude for taking infinite pains. It may be found lacking on occasions in eminent practitioners. The recognition of its importance perhaps accounts for the emergence, now discernible of a class of practitioners who are attracted to midwifery, who do not find its exigencies intolerable and who may be destined to become an element of growing importance in the midwifery service of the nation.

THE BOREDOM OF REPETITION WORK

In Report No. 77 of the Industrial Health Research Board¹ Messrs S. Wyatt and J. N. Langdon (assisted by F. G. L. Stock) describe a further instalment of their investigations on repetitive work which are being made with a view to reducing the boredom inevitable in most employment of this type. The subject is of great practical importance because of the very large and increasing numbers of industrial operatives engaged on repetition work. Previous investigations by Mr. Wyatt and his collaborators were made on small groups of subjects but the present inquiry is of wider scope, for it relates to 355 experienced persons employed on various occupations (for example packing chocolates, making crackers, feeding machines) at four factories. Each worker was interviewed and tested for a period lasting one to two hours and it might be thought that such a procedure would be rather an ordeal. However

it was voluntary, and almost all the operatives seemed to enjoy it. They were asked a number of questions about the periods when they liked their work best and least when the time seemed to pass most and least quickly, what kind of work they would prefer, and so on. The replies of the girls indicated that a third of them were only slightly bored, rather over a third were moderately bored, 23 per cent suffered severely, and 3 per cent were never free from boredom. Boredom was fairly frequent during the first hour of work, and still more during the second hour, while it decreased considerably as the end of the spell drew near. It was greatly mitigated by day-dreaming, for nine tenths of the workers said that they could think of other things while working and the great majority of them appeared to indulge in reveries which were pleasant and connected with real events. Very few seemed to brood over their troubles. Singing and talking were indulged in to some extent, but the most effective antidote to boredom was found to be gramophone music. The factory was equipped with a gramophone amplifier, and loudspeakers, and series of experiments were made with this for a period of six months. The best system was to play the gramophone for alternate half hours throughout the day. Output then increased 6 to 11 per cent during the music, while the total daily output increased 3 to 6 per cent. One step and foxtrots were the most popular; the workers finding that the music "brightens things up," "takes you out of yourself," and "gives you something to occupy your mind." The beneficial effects appear to bear a direct relation to the degree of monotony associated with the occupation. Practically all the operatives agreed that the music did not interfere with work, though those who had to concentrate their thoughts on their work appreciated it less than the others.

The amount of boredom was found to increase with the degree of intelligence of the operatives and with extrovert temperamental tendencies while it was well marked in those who desired creative as distinct from repetitive work. On applying various psychological tests to groups of the most bored and the least bored subjects, it was found that the former preferred an intelligence test and that the latter preferred a test of insertion (manual repetition work). Hence brief performance tests provide useful indications of suitability for repetition work and offer a promising line of research in vocational guidance. Boredom and discontent were noticeably influenced by most of the conditions under which the work was performed, and an elaborate inquiry showed that

¹ *Fatigue and Boredom in Repetition Work*. H.M. Stationery Office (1s 3d).

the factor to which the women attached the greatest importance of all was security of employment. Next in order of choice came comfortable working conditions, pleasant working companions, and a good supervisor. Then came opportunity for promotion and high wages but shorter working hours came very low on the list, probably because they were thought to imply a reduction of wages. Fatigue was seldom complained of, except by a group of girls who had to feed machines at the rate of four units a second. They naturally had difficulty in keeping the machines supplied with material. Taking the girls as a whole, fatigue was considered to be less a cause of dissatisfaction than the time lost in waiting for material and discomfort due to the workrooms being too hot or too cold.

It is not possible to refer here to more than a fraction of the interesting and important results described in this admirable report. It is to be hoped that all large employers of repetition workers will find opportunity to study it thoroughly. If they apply the suggestions indicated they are likely to benefit not only their workers but themselves, for a reduction of boredom and discontent is almost inevitably reflected in an improved output.

CHRONIC MILIARY TUBERCULOSIS IN CHILDREN

That there is a chronic form of miliary tuberculosis which is not invariably fatal has been asserted by various writers in recent years, a point of view which has for some time been maintained in foreign medical literature. A survey of this literature was given in a leading article in the *British Medical Journal*¹ over two years ago under the heading "La Granulie Froide" a term used by Burnand and Saye. We suggested then that the condition known as chronic miliary tuberculosis was perhaps best described by the somewhat cumbersome but more accurate term "chronic disseminated haematogenous tuberculosis with pulmonary localization." In a recent number of the *Archives of Disease in Childhood*² Dr R. H. Fish describes ten cases of chronic miliary tuberculosis in children treated at the High Wood Hospital for Children at Brentwood. Full clinical details are given with illustrations of the x-ray appearances. Six of these patients died and four have recovered. The diagnosis in five of the six cases was confirmed at necropsy and in three of them the healing process in individual miliary nodules was demonstrated. Although it is true that this final proof of the diagnosis was happily not available in the four patients who recovered the similarity of the radiographic appearances and the isolation of tubercle bacilli from the sputum or from the gastric contents would

seem to establish the diagnosis beyond doubt. In fact it appears certain that chronic miliary tuberculosis is not necessarily a fatal disease. Among the many interesting points discussed by Dr Fish is the frequency of extrapulmonary tuberculous lesions, which could only have arisen by the passage of tubercle bacilli into the blood stream, the dissemination of the bacilli is haematogenous. Even in the four patients who have recovered there were apparent evidences of a recurrent tuberculous bacillaemia, and from this Dr Fish argues that the initial lodging of bacilli in the lungs was the result of a similar bacillaemia. He draws attention to the fact that massive caseous glands are frequently found in the upper mediastinum in the juvenile type of chronic miliary tuberculosis and suggests that these glands may be the focus from which haematogenous spread occurs. Of the four patients who recovered the first was a boy aged 3 years who had miliary tuberculosis of the lungs with osseous lesions and who showed marked improvement after sixteen months' illness. The second a boy aged 8 had miliary tuberculosis of the lungs as had the third a boy aged 3 years in whom it was thought that the liver and the spleen were also affected. The last patient a boy aged 6 had chronic miliary tuberculosis of the lungs with abdominal, cutaneous osseous, and cerebral tuberculous lesions. In discussing treatment Dr Fish stresses that all important factor in the treatment of tuberculosis—the need for absolute rest. "Any child," he says "whose chest skiagram suggests miliary tuberculosis should be kept in bed until the stippling has completely disappeared from the [x-ray] picture. Any earlier termination than this involves risk of disaster." It is evident that it is very difficult to keep a child at absolute rest. In the fourth case of recovery recorded by Dr Fish remarkable improvement took place after the patient had been placed in a spinal frame on account of the bony lesions and he suggests that even in the absence of bony lesions this method of immobilization might be used in the treatment of such patients. All the children were nursed on open balconies and four of them received injections of solganol three of these being patients who recovered. The real risk of course is that during the episodes of tuberculous bacillaemia the meninges may become infected and a fatal tuberculous meningitis result a risk which is diminished if absolute rest can be strictly enforced.

REMEDIES FOR LEPROSY

New treatments for leprosy are innumerable. The remarkable thing is that they generally emanate from those who have little practical clinical experience of the disease itself. Doubtless many promoters of these remedies are themselves persuaded after treating a few cases that they have found a sovereign remedy but it is only those who have studied the disease thoroughly and are familiar with its clinical and pathological features who are qualified to evaluate any remedial method. The signs and symptoms of leprosy are caused not by the bacillus but by the reaction of the tissues to the bacillus. Anything which depresses the

¹ *British Medical Journal* 1934 2 815

² *Ann de Méd.* 1924 15 365

³ *Arch Dis Childh* 1937 12, 1

reacting power of the tissues such as intercurrent disease or even a too vigorous course of injections will often give a clinical appearance of improvement, while all the time the patient's condition is really stationary or possibly worse. The course of injections, however, gets the credit of the apparent beneficial results which are misinterpreted by the physician. Another cause of the fallacy is that exacerbation of clinical lesions is often caused by sensitization of the leprosy germ. There are innumerable drugs which have the power of desensitizing the patient and thereby causing considerably temporary clinical improvement. Among these desensitizers are small doses of the heavy metals and many of the aniline dyes. Here again the apparent improvement following desensitization is mistaken for actual clearing up of the infection. Unfortunately there is a tendency to exploit for commercial purposes some of these apparent leprosy "cures." Those who indulge in this form of commercialism cannot realize the mental distress which their advertisements often cause in the minds of sufferers from this disease, whose hopes are raised on hearing of some wonderful cure, only to be dashed to the ground when its efficacy is disproved.

COMPULSORY PASTEURIZATION FOR GLASGOW

On August 20 1936 the Corporation of Glasgow decided to apply for powers to require that raw milk distributed within the city should in certain circumstances be submitted to compulsory pasteurization. In furtherance of this decision a report¹ has been drawn up by two members of the Health Department giving details of the distribution and quality of the milk supply. There is a great deal of valuable information in this report. Of particular interest in relation to the proposed Bill is the present extent of heat treatment of the milk supply in Glasgow. An average daily quantity of 61,100 gallons is consumed in the homes. Of this 5,600 gallons are sold under the official designation of "pasteurized" milk, rather under 1,500 gallons as graded raw milk, and the remaining 54,000 gallons as ordinary milk. No less however than 85.4 per cent of this ordinary milk is submitted to some form of heat treatment before delivery. Investigation shows that 36.5 per cent is heated in plants of the holder type under licence, 25.9 per cent in non-licensed holder plants and a total of 23 per cent in some other form of heating plant—retarder flash scalding or sterilizing. Such a position must be regarded with mixed feelings. On the one hand it is gratifying to learn that such a high proportion of the milk supply is submitted to some form of heat treatment; on the other hand it is a matter of grave concern that such a relatively small proportion of the milk delivered to the public is under adequate official supervision. This situation which is of course far worse in many other cities must be changed. The scientific arguments in favour of pasteurization are over-

whelming. But if we are to press for compulsory pasteurization we must insist that the quality of the initial supply, the heating process itself and the subsequent care of the milk are under the most rigid official control. No one realizing the extent of preventable milk-borne disease will do other than hope for the success of Glasgow's pioneering effort.

PSITTACOSIS

The discovery of the exact causation of psittacosis and the work which this finding led up to has placed the laboratory in the position of being able to give most valuable aid to the clinician in making a diagnosis of this disease. The demonstration that the mouse was susceptible to this virus first made by Krumweide, McGrath and Oldenbusch in America and Gordon in this country gave us an inexpensive experimental animal, and (what is no less important) an animal in which work with psittacosis virus could be carried out with relatively little risk. In human infections the virus is to be found in the blood, the pleural fluid and the sputum, and its presence there can be demonstrated by mouse inoculation. It is in the sputum more particularly that it should be sought, since, as Rivers and others have shown, it is present in this material in greater quantity and more persistently than elsewhere. Although the picture presented by psittacosis infection in the mouse is fairly characteristic, it is on the microscopical demonstration of the virus in smears made from the spleen that one relies in settling the nature of the infection, the procedure is one which presents few difficulties. Up till now it has been the practice to regard laboratory work with viruses as a matter for the specialist; the technical difficulties—sometimes only imaginary—have been thought to place it beyond the scope of the routine laboratory. But although this reticence has in the past been understandable and even commendable, the time has undoubtedly arrived when some of the diagnostic laboratory virus work could safely pass into routine practice. The diagnosis of psittacosis by the isolation of the virus is a case in point and recognizing this the Ministry of Health has published a report on the subject² in the hope that public health bacteriologists will be encouraged to make themselves familiar with this procedure and add it to their diagnostic repertoire. In this pamphlet all the necessary details are set out clearly and succinctly. The bacteriologist well trained in his subject should have no difficulty in carrying them out, though he would be well advised to observe all possible care in handling this virus, since laboratory infections occur. The necessary safeguards are stressed in this report. At the time of the 1930 pandemic of psittacosis it was thought that the sole source of infection in European countries was importation of birds of the parrot family from South America and that by placing an embargo on these birds the danger of human infection would be abolished. This has proved illusory. In this country and in many parts

² *Reports on Public Health and Medical Subjects*, No. 80. Laboratory Diagnosis of Psittacosis. H.M. Stationery Office, 1936.

of Europe cases of psittacosis have continued to occur and it is now known that the home bred stocks are infected though whether this state of affairs existed prior to the 1930 pandemic or is the result of the introduction of infection at that time it is difficult to say. It is also recognized now that many apparently healthy birds are virus carriers and a potent source of human infection. This is particularly true of the budgerigar in which breed of parakeet infection is often inapparent and results in the setting up of the carrier state. Levinthal¹ has drawn attention to latent infection in home-bred birds in this country and human cases have arisen from this source. Thalheimer² has recently recorded a small outbreak in Paris which had its origin in French-bred birds and in Germany in the first half of 1936 there were almost as many cases of human psittacosis as in the whole of 1930 most of them being attributable to contact with apparently healthy budgerigars. Psittacosis is still with us and in cases of continued fever associated with pneumonic symptoms in individuals who have been associated with cage birds more particularly those of the parrot family the clinician will always have to consider the possibility of psittacosis. And in attempting to arrive at a correct diagnosis he should be able to count on valuable assistance from the laboratory.

HOUSSAY'S WORK ON THE PITUITARY

For twenty five years Professor B. A. Houssay has studied the pituitary glands of amphibians and it has been mainly through his work that the central position of this gland in the endocrine system has become so firmly established. But it is only during recent years that his brilliant work has become widely known. Recognition of this was accorded by his appointment to the Dunham Lectureship at Harvard and his lectures were published in the *New England Journal of Medicine* from May 7 to June 4 last year. Houssay dedicates his first lecture to the humble toad on which so much of his work was carried out. Detailed studies were made of the effects of hypophysectomy on various parts and functions of the body. The re-establishment of the animal to normality after hypophysectomy was demonstrated after implantation of the appropriate tissue and by injection of extracts. It was shown that these therapeutic effects could be produced not only with tissue from the same species but also with tissue and extracts from mammalian pituitary. Although the natural pituitary hormones have not been individually isolated and chemically identified it is becoming clear that the gland could be divided physiologically into the neuro intermediate lobe and the principal lobe the former corresponding to the posterior lobe in mammals and the latter to the anterior lobe. It is interesting to note that in the toad the neuro intermediate lobe lies posteriorly and the principal lobe or pars glandularis anteriorly. A long series of experiments showed that the neuro intermediate lobe is concerned with melanophore control of the arterioles and capillaries

and hence of the blood pressure regulation of the activity of the kidney and of the skin and with water metabolism and that it contains powerful oxytocic substances. The principal lobe was shown to contain or secrete gonadotropic and thyrotropic substances and stimulators of growth. Among many other most interesting effects perhaps the most striking was the intimate connexion found to exist between the pituitary and diabetes. Houssay was the first to demonstrate clearly that in the absence of the "anterior" lobe of the pituitary pancreatic and phloridzin diabetes are attenuated and the animals retain and consume glucose. Conversely extracts of the "anterior" pituitary antagonize insulin and accentuate the diabetic manifestations and further it was observed that "anterior" pituitary extracts can produce diabetes in normal animals. The fact that hypophysectomized animals have a greatly increased sensitivity to insulin is thus readily understood as are also the well recognized glycosuria and hyperglycaemia of acromegaly where an acidophil adenoma of the pars glandularis causes an over-production of the anti insulin hormone. How far human diabetes may be in part due to pituitary over-secretion remains to be seen but recent evidence suggests that the blood of diabetics contains an anti insulin agent. The importance of the pituitary in the proper functioning of the gonads and the thyroid is now well known and the profound structural changes which they undergo after hypophysectomy were clearly demonstrated by Houssay. Evidence was also obtained that in some obscure way the pituitary and the pancreas are necessary for the proper functioning of the parathyroids but more work is required on this subject. The position at present is best summed up in Houssay's own words:

The pituitary is the central organ of the endocrine constellation as it is necessary for the development and maintenance of the anatomical and functional integrity of the other internal secretory organs. The anterior pituitary lobe because of its actions on growth metabolism and the endocrine glands, is necessary for the development and maintenance of the individual in a normal state and because of its actions on the sexual and reproductive systems it is necessary for the maintenance of the species. The posterior or neuro intermediate lobe is inferior functionally to the anterior or principal lobe.

THROMBO-ANGITIS OBLITERANS OF THE CORONARY ARTERIES

The pathological entity of thrombo angitis obliterans which affects in particular the vessels both arteries and veins of the extremities of young or middle aged men is known to be often associated with lesions in the coronary arteries. The nature of these coronary lesions is however not certainly established, though they have for the most part been regarded as the same as those degenerative processes which commonly affect the coronaries in older people—namely arteriosclerosis and atheroma. The question whether the specific lesion of thrombo angitis obliterans (Buerger) can occur in the coronaries can be answered only by histological studies. The early acute stage of the process presents a charac-

Levinthal W (1935) *Lancet* 1 1207

Thalheimer M (1937) *Bull Mem Soc Méd Paris* No 2

teristic picture but in the late healed or organized stage it is less distinctive and more easily confused with arteriosclerosis. What appears to be a proved example of Buerger's disease of the coronary arteries has been reported by O. Saphir¹ who in a preliminary review of the literature of the subject comprising fourteen publications could find no other case supported by conclusive evidence. These fourteen papers dealt with thirty men suffering from peripheral thrombo angitis obliterans and coronary disease and it is an important observation that twelve of these were under 40 years of age at the time of death. Saphir's own patient a man of 35 died suddenly and had had intermittent claudication for six years but no symptoms to suggest cardiac disease. At necropsy extensive and advanced disease of the coronary vessels was demonstrated, and in the myocardium there was a diffuse fibrosis with many old organizing infarcts. On section the changes of various stages of Buerger's disease were found in the coronary vessels and also severe arteriosclerotic and atheromatous processes. The early stages of the former were evident from acute inflammatory changes in all coats of the vessels and within the lumina thrombi containing the characteristic milium foci of polymorphonuclear leucocytes histiocytic cells and giant cells. Such foci may at first be confused with a granulomatous lesion until their situation within the vessels is recognized. In some areas there were apparent transitions between arteriosclerotic changes and those of Buerger's disease. The relation between the two is discussed and the author thinks it possible that the degenerative process develops secondarily on the basis of the inflammation a similar sequence is observed with syphilitic and rheumatic arteritis. The fact that coronary occlusion is found in four out of five necropsies on victims of thrombo angitis obliterans and that twelve of thirty men dying of Buerger's disease and coronary lesions were under 40 is not to be explained by mere coincidence but points to some relation between thrombo angitis and coronary arteriosclerosis. The exact part played by this and other forms of arteritis in the development of ischaemic cardiac disease especially in young people has yet to be discovered.

BODY RESERVES OF VITAMIN A

Recent work in the Nutrition Laboratory at Cambridge on the metabolism of vitamin A has been directed to the question of the reserves stored in the body. The liver appears to contain the main reserve of this vitamin and Moore¹ calculates that the typical reserve in an adult would be sufficient to support life for six months and be roughly equal to the amount of vitamin A secreted in breast milk during nine months lactation. These figures are only rough approximations since the daily requirement of vitamin A for a human being is not known. The "typical" reserve in the liver has been taken as the median of a group of forty persons between the ages of 15 and 59 who died within seven days of an accident the patient being presumed to have

been previously healthy. The figure obtained was 220 international units per gramme of liver which gives a total of 330 000 i.u. if 1 500 grammes is taken as the size of an average liver. But variations in the size of the reserve in these apparently healthy people is wide—namely from 75 to 590 i.u. per gramme of liver. It is recognized by Moore that with such wide variations in the normal no deductions can be drawn by comparisons between individual cases. He has tried therefore by arranging the results from 1 000 cases in broad "disease groups" to see what diseases are associated with low median and with high median reserves. There seemed to be a tendency to low reserves over the age of 60 the median figure being 100 i.u. and patients over this age have therefore been excluded from the study. It has previously been noted that there is no correlation either in man or in animals between the vitamin A reserves and the general nutrition of the individual. It was found that in most diseases there was a median well below that of the healthy group and it is quite apparent that only the very low groups can be singled out as of any special interest. The lowest figure was found in a group of thirteen cases of kidney and bladder infections in which the range was from 3 to 320 i.u. and the median 19 i.u. The next lowest figure was in a series of forty eight cases of chronic nephritis ranging from 5 to 150 i.u. with a median of 25 i.u. Discussing the significance of the low reserves, Moore mentions three main possibilities. The low reserve may be the result of long continued illness. Wolff for example has found a slightly lower mean in a group of chronic than in a group of acute diseases. Secondly there may be an interference with the power of the liver to store the vitamin in certain disorders. Thirdly there is the possibility that the low reserve may represent a low dietary intake which is aetiological connected with the disease. Other possible interpretations are that in some conditions the vitamin is poorly absorbed or that, as in the case of vitamin C and infective diseases it is more rapidly used. It would be rash to attempt to assign the reason for the low reserves observed in the groups quoted until further work has been done. One disease was of interest in showing what is probably a significantly high reserve—namely diabetes with a range from 89 to 870 i.u. and a median of 300 i.u. Numerous observations on record suggest there is some abnormality in the utilization of carotene in diabetes. The figures given by Ellison and Moore¹ in a group of 200 children under 15 years show that the reserves at birth are low and begin to rise appreciably at about 4 months. They conclude that the reserves are low in septic diseases but not in acute infections. It must be remembered that even in the disease groups in which low median reserves were found there were always cases with reserves higher than the lowest recorded in the healthy group.

We regret to announce the death of Major General Sir M. Thomas Yarr late R.A.M.C. who was well known for his work in military ophthalmology.

DANGEROUS DRUGS REGULATIONS

Draft Dangerous Drugs Regulations¹ have just been published to amend in certain respects the Dangerous Drugs (Consolidation) Regulations, 1928, and make substantive the provisional rules dated May 1, 1936, which were designed to bring the earlier regulations into conformity with the Pharmacy and Poisons Act, 1933. Some of the new amendments are of interest to medical practitioners. Regulation 9, which relates to the dispensing of prescriptions, has been slightly amended to remove the doubts which have occasionally arisen as to the meaning of the expression "two or three times" in connexion with the repetition of a prescription. The regulation now reads 'a second or third time'. The documents which must be preserved for two years now include signed orders for dangerous drugs given under Rule 7 of the Poisons Rules, 1935. The form of the register of drugs or preparations supplied has been slightly amended by the deletion of the last column—namely the ingredients of the prescription—as it has been found in practice to be unnecessary. The list of drugs for which separate registers or separate parts of the register must be kept has been amended by substituting for dihydro oxycodone and dihydrocodeine the following three groups: dihydrohydroxycodone (commonly known as eucodal) and preparations containing dihydrohydroxycodone, dihydrocodeine (commonly known as dicodide), and preparations containing dihydrocodeine, dihydromorphine (commonly known as dilaide), and preparations containing dihydromorphine.

The general authority granted to certified midwives to be in possession of, and to administer preparations containing opium so far as is necessary for the practice of their profession has now been incorporated in the Dangerous Drugs Regulations in place of the separate authority granted by the Secretary of State in 1921. Persons engaged in testing schemes under the National Health Insurance Acts are now authorized to be in possession of dangerous drugs, and prescriptions issued for such testing purposes are exempted from the Regulations. Similar provision has been made for sampling under the Food and Drugs (Adulteration) Acts. Under the 1928 Regulations prescriptions under the National Health Insurance Acts were not required to specify the address of the persons giving them. This exemption has now been extended to prescriptions given in connexion with the health services of local authorities.

An important amendment has been made in the list of drugs and preparations exempted from the Regulations. In order to bring English legislation into line with the international conventions with regard to exempted preparations, a declaration by His Majesty in Council is to be made with effect from July 1 next, exempting from the Acts, and consequently from the Regulations, all the preparations which have been exempted from the International Opium Convention, 1925, on the recommendation of the Health Committee of the League of Nations. The present Draft Regulations, however, exempt from the Regulations made under Section 7 of the Act only certain other drugs and preparations. Methylmorphine and ethylmorphine are exempted because they are subject to a separate code of regulations, which remains unaltered and certain preparations of these drugs are also included. Cocaine eye drops have been inserted in the list, and pulv. cretae aromat. c. opio B.P. 1932 continues to be exempted.

Draft Dangerous Drugs Regulations 1937 His Majesty's Stationery Office (5d)

Draft Raw Opium, etc. (Consolidation) Regulations² have also been issued under Section 3 of the Dangerous Drugs Act, 1920 for the purpose of consolidating the seven sets of regulations at present in force for controlling and restricting the possession, sale, and distribution of the drugs to which Part I of that Act as amended by the Dangerous Drugs Act, 1925, applies—namely, raw opium, coca leaves, Indian hemp and resins obtained from Indian hemp, and all preparations, other than extract or tincture of Indian hemp, of which such resins form the base.

THE INSURANCE MEDICAL SERVICE WEEK BY WEEK

Reducing the List of an Overworked Doctor

Among other forms of action which an insurance committee is empowered to take when considering the report of its medical service subcommittee after the investigation of a complaint is that of reducing the doctor's list below the general limit approved for the area. The provision in the regulations is as follows:

If the committee is satisfied that owing to the number of persons included in his list the practitioner is unable to give adequate treatment to all those persons it may after consultation with the Panel Committee impose a special limit on the number of insured persons for whom the practitioner may undertake to provide treatment.

Two or three points of interest may be noted with regard to this provision: (1) that it has appeared in the regulations since the earliest days of medical benefit; (2) it is placed first among the actions which the insurance committee may take; (3) it has rarely been put into operation.

A most interesting discussion arose at the public meeting of the London Insurance Committee last week. The Medical Service Subcommittee had appended to its report on a particular case a recommendation that the doctor be censured and that £20 be withheld from his pay. A member of the committee handed in an amendment proposing that the Insurance Committee should also consider whether a reduction should not be made in the doctor's list. In the discussion which followed it was recognized that it would not be proper then and there for the Insurance Committee to come to a decision on the question whether, and if so what, reduction should be made in the doctor's list. The amendment was therefore properly drafted as one providing for due consideration of the question, including its examination by the appropriate subcommittee. Further, the regulation requires that action should be taken only after consultation with the Panel Committee.

The committee therefore accepted the recommendation of the Medical Service Subcommittee and proceeded to consideration of a separate notice of motion with regard to the question of the reduction of the doctor's list, which was adopted after discussion. The fact that this question is to be examined will be communicated to the doctor and the Ministry of Health when submitting the report of the Medical Service Subcommittee and the Insurance Committee's decision thereon. This will presumably leave the doctor with the right of appeal, not only against the original recommendation but also against any decision that may be reached as to the limit of the numbers on his list.

¹ Draft Raw Opium, etc. (Consolidation) Regulations 1937 His Majesty's Stationery Office (2d)

branch can be obtained from the head office of the society. Payment will be made by the societies only in respect of those members who were in the society during the time that the surplus out of which hospital benefit is payable accrued.

Abandonment of Practice

The following is the report of a case in which an assurance organization which was involved financially in the practice communicated with the insurance committee after the doctor had already abandoned his practice. It will be observed that owing to the rapidity with which the clerk to the insurance committee moved in the interests of the insured persons concerned the insurance company was too late to secure that its interests were conserved, even assuming that it would have been possible for the committee to do anything in this direction.

We have been informed that on February 26, 1937, a telephone message was received that a practitioner had been compelled to leave his house on February 25, 1937, for financial reasons, that his furniture had been stored and that the practitioner who was attending that day for an examination in the Bankruptcy Court, was leaving England. In reply to an inquiry as to what arrangements had been made for the treatment of the insured persons concerned it appears that while negotiations had been proceeding for about a week regarding the sale of the practice nothing had materialized, and that the practitioner had been forced to take the step reported above. The person who spoke was informed that unless something was done immediately it would be necessary as a matter of urgency to issue that day a notice to the insured persons concerned informing them that they might select another practitioner. Later in the day the practitioner attended in person at the office and submitted his withdrawal from the medical list with effect from February 26. In the meantime the notices to the insured persons had been prepared and the fact that the premises of the practitioner were unoccupied had been verified by an officer of the committee. The notices were dispatched on February 26.

On February 27 a telephone message was received from an assurance organization stating that it was somewhat heavily involved financially in the practice which it had disposed of to another practitioner and that it proposed to submit to the committee the former practitioner's withdrawal from the medical list and his nomination which had been completed by the company of another practitioner. In view of the action taken on the preceding day the company was informed that it was too late for the committee to consider any further proposition.

Correspondence

IMPLEMENTING THE POLICY OF THE ASSOCIATION AT THE PERIPHERY

SIR,—There is no doubt in my mind that the implementing of policy and even the dissemination of the knowledge of that policy in the Divisions is in a sad state of neglect.

There can be but two reasons for this—namely, apathy of members and inefficiency of Division secretaries. How to eliminate apathy has always been one of the great concerns of all Division secretaries. By inefficiency of secretaries I do not mean that they are willingly inefficient. Honorary secretaries are doing magnificent work and deserve the thanks of all the members of their Divisions but frequently the secretary is a doctor with a growing practice who cannot afford and has no desire to neglect it. It is not the doctor with plenty of spare time who is elected an honorary secretary of a Division.

Being secretary of a big Division means that most of one's spare time must be given to Association work. This means that during a period such as the one through which we have just passed there is not time to carry out secretarial duties properly. The secretariat at Head Office is always more than willing to help but this solves very little of the honorary secretary's difficulties. The failure to obtain the full quota of medical votes

in the recent University election was due entirely to bad peripheral organization.

The remedy lies in the appointment of regional secretaries who must be adequately remunerated. Such a person should not have the ties of general practice to hinder him. It might be possible to include in his duties the routine work of secretary to the Public Medical Service in his region such as the co-ordination of remuneration rates of subscription and terms of service. He would be able to represent the Association on local committees where the times of those committee meetings make it impossible for the average general practitioner to attend without employing a locum tenens. This would cost a good deal of money but it would be well spent and here I think that the Association (including the Treasurer) must readjust its ideas as to spending money for which it cannot for several years see any tangible return.

It will be impossible to assess for many years to come the work of the recently appointed organizer in the London area and if we have to await the results before the provinces can be served in a similar manner we are losing very valuable time. Paid help with the secretarial work is not sufficient; this merely helps the honorary secretary to keep abreast of work and does not enable him to go forward and keep ahead of possible developments. Recruiting would be increased enormously with a regional secretary, and so help to save some of the cost.

There is but one danger and that is that this scheme might lead to a decrease in the amount and character of the voluntary work done for the Association. The possibility of such a thing happening is remote. The more probable result would be an increased voluntary activity since the honorary secretary would have more time for his part of the work. It is important that the voluntary work should not diminish since this is the most potent force in Association activity—I am, etc.,

Birmingham April 21

ARTHUR BEAUCHAMP

JAUNDICE IN LEICESTERSHIRE

SIR—I note in the *Supplement* of April 24 (p. 230) under Public Health Notes that the type of jaundice in an epidemic mentioned in Dr J. A. Fairer's annual report to the Leicester-shire County Council Education Committee is referred to as infective hepatic jaundice.

This designation is incorrect and in the short account given in Dr Fairer's report it is definitely stated that the disease was of the epidemic catarrhal type. Actually this account embodied a few salient features of an investigation undertaken by me, a report of which was published in the *British Medical Journal* of April 3 (p. 703). I was careful in this article to point out the differences in the various types of jaundice and to give the reasons why I concluded that the recent outbreak in Leicestershire was one of epidemic catarrhal jaundice—I am, etc.,

Leicester, April 26

ARTHUR A. LISNEY
Senior Assistant School Medical
Officer

Dr Barclay Barrowman of Klang Selangor Federated Malay States was recently the recipient of the Malay title Dato Semboh di Raja which means "The Healer" in recognition of his services to the Royal Family of Selangor. Dr Barrowman who graduated M.B. Ch.B. Glasgow in 1922 and D.T.M. and D.T.H. Liverpool in 1927 in addition to private practice in Klang acts in an advisory capacity to the Government of the Federated Malay States on malaria control, and annually conducts international teaching courses on this subject under the auspices of the League of Nations. Since 1930 Dr Barrowman has been physician to the Raja Muda of Selangor and the Royal Family.

Dr Lachlan Grant of Ballachulish chairman of the Highland Development League, has published in pamphlet form his address to the senior scholars of Kinlochleven Public School entitled "Good Education and Well Spent Holidays." He has also contributed to the *Northern Times* of April 8 a thoughtful article on "Development and Reconstruction" discussing various problems of to-day with special reference to the Highlands and Islands of Scotland.

Group of Psychological Medicine of the Association

Notice is hereby given of the formation by the Council of a Group of Psychological Medicine, which shall be composed of all those members of the Association who are engaged predominantly in the practice of psychological medicine. Every member of the Association coming within this definition is *ipso facto* a member of the Group. Members of the Association who claim to conform to this definition are requested to notify the Medical Secretary, B.M.A. House, Tavistock Square, W.C.1, not later than May 22, 1937. The first general meeting of the Group will be held at a date to be subsequently announced in the Supplement.

April 28

G. C. ANDERSON
Medical Secretary

Scholarships and Grants in Aid of Scientific Research

Scholarships

The Council of the British Medical Association is prepared to receive applications for Research Scholarships as follows: an Ernest Hart Memorial Scholarship, of the value of £200 per annum; a Walter Dixon Scholarship, of the value of £200 per annum; and three Research Scholarships, each of the value of £150 per annum. These Scholarships are given to candidates whom the Science Committee of the Association recommends as qualified to undertake research in any subject (including State medicine) relating to the causation, prevention or treatment of disease. Preference will be given other things being equal to members of the medical profession. Each Scholarship is tenable for one year, commencing on October 1, 1937. A Scholar may be reappointed for not more than two additional terms. A Scholar is not

necessarily required to devote the whole of his or her time to the work of research, but may hold a junior appointment at a university, medical school, or hospital provided the duties of such appointment do not interfere with his or her work as a Scholar.

Grants

The Council of the British Medical Association is also prepared to receive applications for Grants for the assistance of research into the causation, treatment, or prevention of disease. Preference will be given, other things being equal, to members of the medical profession and to applicants who propose as subjects of investigation problems directly related to practical medicine.

Conditions of Award Applications

Applications for Scholarships and Grants must be made not later than Saturday, May 8, 1937, on the prescribed form a copy of which will be supplied on application to the Medical Secretary of the Association, B.M.A. House, Tavistock Square, London, W.C.1. Applicants are required to furnish the names of three referees who are competent to speak as to their capacity for the research contemplated.

Branch and Division Meetings to be Held

BORDER COUNTIES BRANCH—At Cumberland Infirmary Carlisle, Thursday, May 6, 3.15 p.m. Dr Robert Gow McInnes, Mental Health.

EDINBURGH BRANCH SOUTH EASTERN COUNTIES DIVISION—At Royal Hotel, Glasgow, Wednesday, May 5. Annual meeting. Election of officers. Consideration of Annual Report of Council etc.

GLASGOW AND WEST OF SCOTLAND BRANCH LANARKSHIRE DIVISION—At St Enoch Station Hotel, Glasgow, Wednesday, May 5, 3.30 p.m. Dr John D. Comrie (Edinburgh). History of Glasgow Medicine.

HERTFORDSHIRE BRANCH BARNET DIVISION—At Welland House, New Barnet, Tuesday, May 4, 8.30 p.m. Dr A. F. Hurst. The Origin and Treatment of Diseases of the Alimentary Tract.

HERTFORDSHIRE BRANCH EAST HERTFORDSHIRE DIVISION—Thursday, May 6, 2 p.m. Golf competition.

LANCASHIRE AND CHESHIRE BRANCH BURY DIVISION—At Jersey Hall, Bury, Friday, May 14. Coronation dinner and dance.

LANCASHIRE AND CHESHIRE BRANCH ROCHE DALE DIVISION—At Rochdale Infirmary, Friday, May 7, 8.30 p.m. Annual meeting. Election of officers etc. Dr T. Milnes Bide. Some Common Pitfalls in Diseases of the Eye.

METROPOLITAN COUNTIES BRANCH CITY DIVISION—At Metropolitan Hospital, Kingsland Road, E., Tuesday, May 4, 9.30 p.m. Mr W. Gilling Ball. "Chronic Infections of the Urinary Tract."

METROPOLITAN COUNTIES BRANCH HAMPSTEAD DIVISION—At Hampstead General Hospital, Thursday, May 6, 8.30 p.m. Consideration of Annual Report of Council and election of representatives and deputy representatives.

METROPOLITAN COUNTIES BRANCH NORTH MIDDLESEX DIVISION—Wednesday, May 5. Annual meeting.

NORTHERN IRELAND BRANCH BELFAST DIVISION—Thursday, May 6, 4.15 p.m. Annual general meeting.

NYASALAND BRANCH—At King Edward VII Memorial Hall, Blantyre, Saturday, June 5, 10 a.m. Scientific meeting.

SOUTH WALES AND MOUNTAINSHIRE BRANCH SWANSEA DIVISION—Thursday, May 6. Consideration of Annual Report and Election of Representative.

SOUTHERN BRANCH PORTSMOUTH DIVISION—At Queen's Hotel, Southsea, Thursday, May 6, 9.30 p.m. Annual general meeting. Preceded by supper at 9 p.m.

SURREY BRANCH CROYDON DIVISION—At Croydon General Hospital, Tuesday, May 4, 8.30 p.m. Annual general meeting.

SURREY BRANCH KINGSTON-ON-THAMES DIVISION—At Kingston and District Hospital, Tuesday, May 4, 8.30 p.m. Annual general meeting. Election of officers. Consideration of Annual Report of Council.

SUSSEX BRANCH BRIGHTON DIVISION—Joint meeting with the Brighton Hive and District Teachers' Association at the Grand Hotel, Brighton, Tuesday, May 4, 8.30 p.m. Dr Norman Maple. Chaos to Cosmos. Preceded by supper at 7.30 p.m.

YORKSHIRE BRANCH WAKEFIELD, PONTEFRAC and CASTLEFORD DIVISION—At Strallford Arms Hotel, Wakefield, Thursday, May 6. Annual general meeting. Preceded by dinner at 7.45 p.m.

Meetings of Branches and Divisions

ABERDEEN BRANCH CITY OF ABERDEEN DIVISION

At a meeting of the City of Aberdeen Division held at Aberdeen on February 18 with Dr J A INNES in the chair a British Medical Association Lecture on 'The Toxaemias of Late Pregnancy' was given by Professor F J BROWNE. Over eighty members and guests were present. Professor Browne classified the toxaemias (1) pre-eclamptic toxaemia and eclampsia (2) nephritic toxaemias (3) essential hypertension, and (4) accidental haemorrhage. Discussing pre-eclamptic toxaemia the lecturer stressed the importance of taking the blood pressure, pointing out how a rise was frequently the first sign of this condition. In mild cases there should be rest, but not necessarily in bed, and a low protein diet with plenty of vegetables, fruit salad and one pint of milk daily. In severer cases with a blood pressure of 150/100 or over with or without oedema or albuminuria rest in bed was essential. If there was oedema a salt free diet and fluid restriction were called for. Moreover the blood pressure and quantity of urine should be recorded daily. If the condition did not become normal in three weeks pregnancy should be terminated to prevent chronic nephritis. If however the foetus was already viable (thirty fifth week) pregnancy should be terminated within a week. In the pre-eclamptic state when the signs were more marked complete starvation was called for and glucose water by the mouth, brisk purgation, and venesection to 10 to 20 ounces should be resorted to. If there was no rapid improvement in a day or two the pregnancy must be terminated in urgent cases by Caesarean section in less urgent cases by bag or bougie.

As regards the nephritic toxaemias it was usually wise to terminate the pregnancy—exceptions to this rule were rare. The best management in these few cases was complete rest in bed till the child was viable and then Caesarean section. It had to be noted that the foetus often died *in utero* from placental infarction in spite of every care. In essential hypertension there was usually no need to terminate the pregnancy. An attempt should be made to keep the blood pressure under 180 systolic and 110 diastolic. The risk of accidental haemorrhage and of foetal death had to be kept in mind. Termination of the pregnancy was therefore often indicated once the foetus was viable. A discussion taken part in by Professor D BAIRD, Mr G S DAVIDSON, Dr G MITCHELL (fnsh) and Dr J CRAIG followed. On the motion of the CHAIRMAN Professor Browne was accorded a very cordial vote of thanks for his lecture.

Problems of Urinary Infection

A further meeting of the City of Aberdeen Division was held at Aberdeen on March 18 with Mr A FOWLER in the chair when Professor J R LEARMONTH gave an address on

Certain Problems of Urinary Infection in Practice. The lecturer enumerated the various routes by which it was possible for organisms to reach the urinary tract. While extension of infection within the tract from kidney to bladder followed the urinary tide the so-called ascending type of infection was less easy to explain. Histological investigations failed to produce evidence that ascending invasion occurred by way of the perireteral lymphatics. One hypothesis suggested that as a result of the irritation of vesical infection there was an upset in the physiological mechanism controlling both the passage of urine along the ureter and its entrance into the bladder. According to this view the uretero-vesical orifice might be opened during the act of micturition and so allow the entrance of infected urine. This was actively propelled to the renal pelvis by peristaltic movements of the ureter of necessity in the opposite direction to the normal. It was pointed out that the majority of bacterial invaders of the urinary tract were derived from a source within the body. Of the haematogenous group cocci were derived from cutaneous and less often from nasopharyngeal lesions, while bacilli of the colon group were from the large bowel. In bacillary infections patients might be divided into three groups: those with definite intestinal lesions; those with constipation; and those without history or signs of intestinal trouble. In an endeavour to find an explanation of the frequency of urinary infections in practice and especially those of the relapsing and chronic types there were two accessory factors—trauma and obstruction to the urinary flow. Though at first each might operate alone in the majority of cases ultimately they are present together.

A classification of the types of cases met with in general practice and which should be useful in everyday work was suggested.

A Urinary infection which did not give rise to clinical features referable to the urinary tract.

B Conditions which clinically aroused suspicion that infection of the urinary tract was present but evidence of this in the urine was lacking.

C Urinary infections in which both the history and the examination of the urine provided the diagnosis.

The importance of obtaining the history of a thorough physical examination of examination of the urine and of radiography and visualization of the urinary tract was emphasized.

In conclusion the lecturer said that every urological condition and particularly every infective condition should be considered primarily in terms of renal function. To-day there were at our disposal accurate methods of ascertaining the data upon which we could form an opinion and we should do our patients less than justice if we failed to utilize these methods.

A discussion followed in which Professors D BAIRD and CRUICKSHANK and Dr R BRUCE took part. On the motion of Mr A MITCHELL, Professor Learmonth was accorded a very cordial vote of thanks for his address.

BIRMINGHAM BRANCH NUNEATON AND TAMWORTH DIVISION

At a meeting of the Nuneaton and Tamworth Division held at Atherstone on March 17 the following officers were elected.

Chairman Dr J V L Grant Joint Honorary Secretaries Drs T H Forrest and P G Horsburgh Representative in Representative Body Dr W Lowson

Plans were then considered for a course of instruction in anti-gas measures and the acting honorary secretary Dr P A V Barford was instructed to make the necessary arrangements.

BIRMINGHAM BRANCH WARWICK AND LEAMINGTON AND RUGBY DIVISIONS

At a joint meeting of the Warwick and Leamington and Rugby Divisions held at Leamington Spa on April 8 Dr C H Gregory of Rugby was elected representative of the two Divisions in the Representative Body and Dr A S Murray of Stratford on Avon was elected deputy representative.

CALCUTTA BRANCH

At the annual general meeting of the Calcutta Branch held at Calcutta on February 12 with the president Lieut.-Colonel E O G KIRWAN I.M.S. in the chair the reports for 1936 of the Branch Council the honorary treasurer and the honorary secretary were read and adopted. The following officers were elected.

President Rai Dr U N Roy Chaudhuri Bahadur Vice Presidents Dr M N De and Lieut.-Colonel E H Vere Hodge I.M.S. Honorary Secretary Dr J P Chaudhuri Honorary Treasurer Dr K Banerjee

Dr S Sinha was appointed convenor of the clinical meetings of the Branch. A resolution was passed recording the appreciation of the members of the Branch of the visit of the Medical Secretary Dr G C Anderson and the secretary was instructed to forward a letter to Dr Anderson informing him of the resolution.

DORSET AND WEST HANTS BRANCH BOURNEMOUTH DIVISION

At a meeting of the Bournemouth Division held at Boscombe Hospital on March 24 with Dr J C A NORMAN in the chair Dr C F PEDLEY read a paper on 'Some Experiences in the Conduct of Maternity and Child Welfare Clinics and Medical Inspection of School Children'.

Discussing the school medical service Dr Pedley said that in Bournemouth there were about 10,000 children to be examined. All these were seen first when they entered school then between the ages of 8 and 12 and again when they left school. Parents had the right to object to their children being examined by a school medical officer; they were also invited to be present at the examination if they so wished and very often they availed themselves of this opportunity. A record card was kept for each child examined on which all defects were noted. The school medical officer kept the general practitioner constantly in mind, nothing being done to interfere with any treatment the latter was carrying out. Dr Pedley did not attach great importance to the weight of a child but rather to the physical development. Mouth breathing, he thought, should always be looked upon as pathological and meant that there were diseased tonsils and adenoids which required operative treatment. The chest was carefully examined at these school inspections and he was of the opinion

that tuberculosis was rare in young children but that chronic bronchial catarrh was common especially in those who had had whooping-cough in early infancy. This chronic bronchial catarrh if neglected, sometimes led to bronchiectasis.

An interesting discussion followed in which the CHAIRMAN Drs RICHARDSON LITHERLAND DIXON GREEN ROOLE CARTER, ASTEN and LUKER took part and a hearty vote of thanks was accorded Dr Pedley for his interesting and instructive paper.

EAST YORKSHIRE BRANCH

Members of the East Yorkshire Branch in association with the Hull Medical Society and the Yorkshire Council of the British Empire Cancer Campaign, attended a meeting at Hull on April 2 to hear Dr A. T. TODD deliver a lecture on "The Medical Treatment of Cancer with Special Reference to Inoperables." He described the use of selenium and lead combined into colloidal lead selenide which was tried only on inoperable cases: good results were obtained, 10 per cent of the cases remaining cured. Experiments were also conducted combining irradiation or deep x-ray therapy with the colloidal treatment. The lecturer advocated the general rather than the local use of cancer therapy. His method was to inject intravenously the colloid—one dose each week—and two days after each injection irradiation was given. Dr Todd described methods for the relief of pain. It was essential that the nutrition of the patient be maintained and that fear be dispelled. He gave statistics of the results obtained. He recommended six months' treatment with selenium and irradiation for operable cases after excision of the growth.

Drs R. GRIEVE, CORBETT, CRIPPS, A. M. MILLAR, and EVE took part in the discussion which followed and a vote of thanks was proposed by Mr J. F. GULL and seconded by Dr D. MACRAE TODD.

On April 7 a party of members of the Branch and their ladies numbering fifty, toured the factories of Messrs T. J. Smith and Nephew Ltd. Hull. The tour lasted one and a half hours, several processes being fully demonstrated and explained. Later tea was provided in the social hall. Dr S. F. FOURACRE proposed a vote of thanks to the management for the very interesting afternoon, and Dr EVE seconded. Mr H. N. Smith briefly responded.

EDINBURGH BRANCH LOTHIAN DIVISION

A meeting of the Lothians Division was held at B.M.A. House, Edinburgh on April 14 when there was a discussion on the Scottish Maternity Services Bill. A small committee was appointed to meet the medical officers of health of Mid Lothian and East Lothian to consider what steps should be taken in those counties. It was unanimously agreed that the fee for services to be rendered under the Bill should not be less than £3 3s.

EGYPTIAN BRANCH

The Egyptian Branch held a very successful meeting on March 30 when Professor F. H. SMITH gave an account of some recent work done in the pharmacology department of the Egyptian University on a blood pressure raising reflex. A discussion followed. Dr ROLAND WILSON who presided, congratulated the speaker on his work and his interesting exposition of it.

FIFE BRANCH

The first clinical meeting for 1937 of the Fife Branch was held at Kirkcaldy Station Hotel on March 11 when the B.M.A. fracture film was shown to a representative audience. Dr G. M. FIFE, president of the Branch, presided and an address on "The Modern Treatment of Fractures" with a commentary on the film was delivered by Mr D. STEWART MIDDLETON (Edinburgh). The lecturer sketched the development of treatment from fixation by wooden splints (often unsatisfactory) preceded by reduction more or less accurate and followed by early passive movement the results usually being prolonged incapacity with atrophy of the affected limb. The reaction to this form of treatment was the method introduced by Lucas Chirpionnière consisting in early massage and passive movements: less attention being paid to accurate reduction and fixation. Except in cases of malunion the lecturer showed how early passive movements tended to defeat their object by straining the injured parts and thus preventing the normal increase of natural mobility while active movement governed by the patient's sensations gave much better results. The modern treatment of fractures required three essentials: (1) accurate reduction, (2) complete immobilization of the fracture, (3) active use of the limb. Complete immobiliza-

tion of the fracture could only be secured by an accurately fitting plaster splint, and this method, as introduced by Böhler was now the one employed. The importance of early active movements or exercises was emphasized the work of the masseur being no longer massage and passive movements but rather the direction of exercises and the encouragement of active movements.

Many members took part in the discussion which followed and a very hearty vote of thanks was accorded Mr Stewart Middleton for his instructive and interesting address.

GIBRALTAR BRANCH

A meeting of the Gibraltar Branch was held on January 21 with Colonel A. N. FRASER, D.S.O. in the chair. Dr A. MC. K. FLEMING, M.C. opened a discussion on "Tuberculosis Control in Gibraltar." He described the organization for the control of tuberculosis as it existed in England, and explained the modifications which would be necessary to make the scheme adaptable to conditions in Gibraltar. The lecturer stated that a sanatorium and dispensary would be built in connexion with the proposed scheme and would be known as the King George V Memorial Hospital. He appealed for the co-operation of the medical practitioners in carrying out the campaign against the disease. A lively discussion followed in which the PRESIDENT Dr GILL, Dr DEALE, Dr DURANTE, Dr GIRALDI and Colonel DIXON took part, and the meeting terminated with a hearty vote of thanks to Dr Fleming for his address.

On April 6 the Branch held a clinical meeting at the Colonial Hospital when in the absence of the president the vice president, Dr A. A. RUSSO, occupied the chair. Several Naval medical officers were present as guests. After tea had been served the members and guests proceeded to the wards where a series of demonstrations were given by the staff. Dr J. LOCHHEAD showed a case of pyaemia and a series of radiographs of a case which had been successfully operated on for coloproctitis due to tethering down of the colon by bands. Dr J. E. DEALE demonstrated: (1) A series of radiographs of severely comminuted fractures in which the degree of comminution was out of all proportion to the severity of the causative violence. (2) Fracture of the lumbar spine successfully treated by hyperextension. (3) Fracture-dislocation of the second cervical vertebra caused by a sudden movement of the head while combing the hair. (4) Radiographs of a case of bilateral renal calculi with abscess formation. Dr GILCHRIST showed a radiograph of ossified nodules of unknown aetiology in the ligamentum patellae and a patient with a haematoma of the testicle. Dr FLEMING demonstrated: (1) Radiographs of pulmonary tuberculosis treated by artificial pneumothorax, (2) a case of headaches associated with an extraordinarily high lymphocyte count in the cerebrospinal fluid, and (3) a case of amyotrophic lateral sclerosis.

A very successful meeting terminated with a unanimous vote of thanks to the lecturers for their interesting demonstrations.

KENYA BRANCH MOMBASA DIVISION

At a special meeting of the Mombasa Division held at the Native Civil Hospital Mombasa on February 24 with Dr S. D. KARVE in the chair, Dr A. R. PATERSON gave an address on "Yellow Fever" in which he urged members of the Division to do their utmost to educate the public on this subject. At the conclusion of the meeting a vote of thanks was accorded Dr PATERSON for his lecture.

LANCASHIRE AND CHESHIRE BRANCH PRESTON DIVISION

A joint meeting of the Preston Division and the Preston Medico-Ethical Society was held at Preston Royal Infirmary on April 13 when through the courtesy of Messrs T. J. Smith and Nephew Ltd., a film entitled "Cellona Film on Fractures" was shown. The film demonstrated the use of cellona chiefly in combination with local anaesthesia for fixation of fractures of the upper and lower extremities. There was a large audience and an interesting discussion took place.

LANCASHIRE AND CHESHIRE BRANCH ROCHDALE DIVISION

At a meeting of the Rochdale Division held at Rochdale Infirmary on March 12, Dr L. KILROE was elected representative in the Representative Body and Drs J. F. KNOX and A. M. McMASTER were elected deputy representatives.

Dr J. F. WILKINSON (Manchester) delivered a lecture on "The Diagnosis and Treatment of Some Common Anaemias." Dr Wilkinson said that he would confine his remarks to the consideration of primary microcytic anaemia and pernicious anaemia. In the examination of a case the clinical history

was of great importance. Next a complete blood count was essential and a fractional gastric analysis should also be done. Having established a diagnosis of microcytic anaemia iron should be administered in adequate doses about 90 grains of ferri et ammon cit or 18 grains of ferrous chloride represented the average daily dose required. The treatment should be controlled by frequent blood counts, and when the case was considered to have reached the stage of cure re-examination at intervals of three or six months was advisable. Pernicious anaemia generally required rest in bed in the early stages of treatment with a full normal diet. Stomach extract or liver extract was essential, care being taken in the case of stomach extract not to administer it in hot fluids as these destroyed the active principles. Symptomatic treatment also required attention. Complications which might be present—for instance hypothyroidism—should be treated independently of the anaemia. Dr Wilkinson illustrated his remarks by lantern slides and diagrams. The lecture was followed with great interest and many members took part in the discussion and questions after the lecture. On the proposal of Dr W. H. BATEMAN seconded by Dr H. N. CROSSLEY Dr Wilkinson was cordially thanked for his lucid and practical address.

At a joint meeting of the Bury Oldham and Rochdale Divisions held at Rochdale on April 9 with Dr J. CURRIE chairman of the Oldham Division in the chair Mr GEOFFREY JEFFERSON (Manchester) delivered a British Medical Association Lecture entitled "An Account of Eight Cases of Operation for Removal of a Frontal Lobe of the Brain with Six Recoveries." Mr Jefferson had originally intended to lecture on the surgical treatment of intractable pain but he explained that he had been moved to change his subject because he had spent the early part of his life in Rochdale, and he wished to make the first communication of this paper to a Rochdale audience. The paper which will appear in due course in the columns of the *Journal* records a most important stage in the history of brain surgery. It represents the first account of any considerable number of successful operations of this nature. Mr Jefferson's audience appreciated the privilege of being the first to hear this communication. Drs C. ROBERTSON WILSON and McMASTER expressed the thanks of the meeting to Mr Jefferson for his lecture.

LINCOLNSHIRE BRANCH LINCOLN DIVISION

At a meeting of the Lincoln Division, held at Lincoln on March 11, Dr R. D. LAWRENCE read a paper on "The Practitioner and Diabetic Emergencies."

Dr Lawrence said that the majority of diabetics were today sent to hospital, where they were put on a diet and given insulin. After they came out however they often became too independent, and in consequence the practitioner was faced with many difficulties. Referring to patients under treatment with insulin Dr Lawrence stressed the fact that sugar in the urine was not serious but that acidosis was. Starvation and vomiting produced the dangerous condition of ketosis. Another cause of trouble was muscular exercise after insulin as the effort involved used up sugar. Any illness tended to make diabetes worse and necessitated an extra dose of insulin but if vomiting was marked it was as well to cut down the insulin by half. Dr Lawrence next dealt with the differential diagnosis of hyper and hypoglycaemia when in doubt it was best to give sugar.

In the treatment of true coma repeated insulin with ample sugar was necessary and many cases would need large quantities of saline, four to eight pints by the continuous intravenous drip method.

Questions were asked by Drs H. C. BARLOW LEVIS G. C. WELLS-COLE, A. C. FRASER, MAIDEN and SHARRARD.

In replying Dr LAWRENCE gave an outline of treatment with zinc protamine insulin.

A hearty vote of thanks was accorded Dr Lawrence for his address on the motion of Dr BARLOW seconded by Dr F. ALCOCK.

METROPOLITAN COUNTIES BRANCH GREENWICH AND DEPTFORD DIVISION

The Greenwich and Deptford Division held a dinner and dance at Chiesman's Restaurant on March 11. This was the first event of the kind and there was a most gratifying response, no fewer than 121 people sitting down to dinner. Dr W. B. SILAS the chairman of the Division presided with Sir Walter and Lady Langdon Brown as the principal guests. The toast of "The Division" was proposed by Dr HAROLD PRITCHARD and the CHAIRMAN replied. The toast of "The

Guests" was proposed by Dr W. SMITH. Sir WALTER LANGDON BROWN replying. After dinner there was dancing, which continued until 1 a.m.

NORTH OF ENGLAND BRANCH MORPETH AND BLYTH DIVISIONS

A joint meeting of the Morpeth and Blyth Divisions was held at Ashington on March 19, when Mr J. K. STANGER (Newcastle upon Tyne) delivered an interesting lecture on "Back Injuries." Mr Stanger confined himself to injuries of the muscles and to fractures of the spine. His address was illustrated by lantern slides showing the method of treatment of a fractured spine and by radiographs of various cases. On the motion of Dr A. A. BONAR, seconded by Dr M. BRUCE a hearty vote of thanks was accorded to Mr Stanger for his address.

The following officers of the Morpeth Division were then elected:

Chairman Dr T. S. Blaiklock Vice-Chairman Dr Murdo Maclean
Honorary Secretary Dr Dugald Revie Charities Secretary Dr W. Stephenson Golf Secretary Dr Bonar

NORTHERN IRELAND BRANCH BELFAST DIVISION

A meeting of the Belfast Division was held in the Whitla Medical Institute Belfast, on April 15 with Dr S. E. A. ACHESON in the chair. The Division had the pleasure of welcoming Dr G. C. Anderson Medical Secretary of the Association who gave an interesting and stimulating address entitled "The British Medical Association and Future Medical Practice."

Dr Anderson began by outlining the objects and activities of the B.M.A. touching briefly on its contributions to medical education and scientific advance to the ethical aspect of practice and to the maintenance of the interests of medical practitioners in public services. The Association had contributed to the promotion of national health and its scheme for a General Medical Service advocated an extension of the principles of national health insurance to everyone who conformed to certain standards of income and to their dependants, together with specialist benefits. As it was unlikely that such an extension could take place for some years, the B.M.A. was leading the profession in forming its own Public Medical Service on lines comparable with the national health insurance schemes. It was however entirely controlled by medical men. Passing to the hospital problem Dr Anderson spoke of the change which had taken place in the hospital system. Formerly a service for the very poor it was now resorted to by almost all classes of the community and all but the poorest were now asked to contribute. The consulting staff however still gave their services free and this was from every point of view a mistake. In country areas especially the absence of remuneration restricted the supply of consultants below what was necessary. Referring to the maternity services Dr Anderson reminded the meeting how the reduction in maternal mortality hoped for after the introduction of ante-natal clinics had not taken place. This was because there was no continuity of care. Advance would only result when the general practitioner formed an integral part of any maternity service. A cordial vote of thanks was accorded Dr Anderson on the motion of Professor R. J. JOHNSTONE, seconded by Dr JOHN ARMSTRONG.

SOUTH WESTERN BRANCH PLYMOUTH DIVISION

A meeting of the Plymouth Division was held at the Central Police Station Plymouth on March 17 when Dr S. NOY SCOTT was in the chair. The large number of members present were divided into parties each party being under the care of one of the staff of the C.I.D., who demonstrated various phases in the detection of crime. Members were very much impressed by the high standard of efficiency attained by the C.I.D. of Plymouth and could have continued to ask questions until a much later hour. At the conclusion of the demonstration members were entertained most generously to a buffet supper the Chief Constable acting as host ably seconded by Superintendent W. T. Hutchings and his colleagues. This hospitality was a complete surprise to the Division and was thoroughly enjoyed. A vote of thanks to the Chief Constable and Superintendent Hutchings was proposed very eloquently by Dr E. WORDLEY who said that as compared with the life of police the life of the average doctor was one of peace and joy. The vote of thanks was seconded by the honorary secretary Mr C. F. MAYNE and carried with acclamation. The Chief Constable in reply said that he and his colleagues were very happy indeed to welcome the members of the

British Medical Association and emphasised that anything which brought his Department into closer collaboration with the medical profession was much to be encouraged

STIRLING BRANCH

A clinical meeting of the Stirling Branch was held at Stirling Infirmary on March 31 when Dr P F MacFARLAN described the injuries to the internal semilunar cartilage of the knee-joint and illustrated the method of treatment with two cases. Two cases of tuberculosis of the spine in children treated by an Albee operation with excellent results were also shown. Dr W B G Angus described and illustrated a case of advanced tabes dorsalis with Charcot's joints multiple fractures and other parasyphilitic lesions. Dr EVA CAIRNS illustrated the value of pronitosis treatment in three cases of puerperal fever and showed how x-ray examination and the Aschheim Zondek test for pregnancy had been employed in the diagnosis of an obscure case of early pregnancy complicated by dermoid cyst. Dr G L REID described how ganglionectomy could be used for the relief of pathological conditions, and illustrated his remarks with a case of bilateral removal of the stellate ganglion for Raynaud's disease, and a case of lumbar sympathectomy for the relief of pain in advanced rheumatoid arthritis of the hip-joint.

After a vote of thanks to those who had demonstrated cases the meeting proceeded to the election of Dr C Melville as representative in the Representative Body.

SUDAN BRANCH

At a meeting of the Sudan Branch, held at the Kitchener School of Medicine on February 8 the president Dr F S MAYNE, read a paper entitled "A Review of Methods Used for Extension in Fractures of the Lower Limb." Dr Mayne described the six principal methods as strapping, Sinclair's glue, Hamilton Russell parallelogram of forces, Steineman's pins, Pearson's ice tong calliper and Kirschner wires and stirrups. The advantages and disadvantages of the various methods were discussed and a number of slides were shown. Reference was also made to the Smith Petersen nail for fractured neck of the femur and slides were shown illustrating how it can be inserted by the use of Kirschner wire guides and portable x-ray apparatus. A vote of thanks was accorded to Dr Mayne for his address, and the meeting adjourned.

SURREY BRANCH KINGSTON-ON-THAMES DIVISION

At a meeting of the Kingston-on-Thames Division held at the Kingston and District Hospital on March 9 with Dr A S HOLLIS in the chair Dr R D LAWRENCE gave an address on "Diabetic Emergencies and the General Practitioner." The lecturer started by explaining in detail the reasons for the fluctuations in the blood sugar which controlled the onset of diabetic and hypoglycaemic coma. The differential diagnosis between the two states he said might cause great difficulties but it should be remembered that insulin coma usually came on suddenly frequently at noon or midnight when the blood sugar reached its lowest curves and was dramatically cured by sugar and that diabetic coma had a gradual onset occurred at the times when the blood sugar was highest and did not react to sugar. Where there was doubt the urine could be withdrawn by catheter it might contain sugar in both conditions but a further specimen in 10 minutes would be sugar free in hyperglycaemia and loaded in diabetic coma. The test administration of two lumps of sugar would not do material harm in cases of hyperglycaemia but would cause rapid improvement in early cases of insulin coma. In answer to questions Dr Lawrence stated that there was no satisfactory oral substitute for insulin. Zinc protamine insulin was a hopeful new form which required only one injection a day but was not as yet really out of the experimental stage. The meeting closed with a vote of thanks proposed by the CHAIRMAN.

SURREY BRANCH RICHMOND DIVISION

At a meeting of the Richmond Division held at Richmond Royal Hospital on March 12, with Lieut.-Col. E. L. GOWLAND D.S.O. in the chair Dr ROBERT FORBES read a paper on "Medico-Legal Problems on General Practice." Dr Forbes began by urging practitioners to be accurate in making out certificates, and told of the risks of not having an x-ray examination of every injury due to a fall or blow. He referred to the duties of medical practitioners in cases of illegal operations and abortion. A long and interesting discussion followed in which most members present took part. On the motion of the CHAIRMAN a hearty vote of thanks was accorded Dr Forbes for his address.

VACANCIES

- ABERDEEN ROYAL INFIRMARY—(1) Surgical Registrar Salary £200 p.a. (2) Second Hon Ophthalmic S
- ANNIE MCCALL MATERNITY HOSPITAL Jeffreys Road S.W.—M.O (female) Salary £100 p.a.
- ASHFORD GROSVENOR SANATORIUM—R.H.P. (male) Salary £100 p.a.
- BARNSELY BECKETT HOSPITAL AND DISPENSARY—C.O. (male) Salary £150 p.a.
- BATH AND WESSEX CHILDREN'S ORTHOPAEDIC HOSPITAL—H.S. Salary £120 p.a.
- BECKENHAM BOROUGH—Assistant M.O.H. and School M.O.
- BEDFORD COUNTY HOSPITAL—Second H.S. (male unmarried) Salary £150 p.a.
- BELFAST SAMARITAN HOSPITAL FOR WOMEN—Hon Junior Assistant Visiting S
- BENEDEN NATIONAL SANATORIUM—Medical Superintendent Salary £600-£50-£750 p.a.
- BIRMINGHAM CITY—A.R.M.O. (male unmarried) for the Tuberculosis Section Salary £400-£25-£450 p.a.
- BIRMINGHAM QUEEN'S HOSPITAL—R.S.O. Salary £150 p.a.
- BOLINGBROKE HOSPITAL Wandsworth Common S.W.—(1) C.O. (2) H.S. Males unmarried Salaries £120 p.a. each
- BOURNEMOUTH ROYAL NATIONAL SANATORIUM—A.R.M.O. (male, unmarried) Salary £200 p.a.
- BRIGHTON ROYAL ALEXANDRA HOSPITAL FOR SICK CHILDREN—H.S. (male) Salary £120 p.a.
- BRIGHTON ROYAL SUSSEX COUNTY HOSPITAL—H.S. (male) Salary £150 p.a.
- BRISTOL ROYAL INFIRMARY AND BRISTOL GENERAL HOSPITAL—Two Hon Radiologists
- BURY INFIRMARY—(1) Third H.S. (2) C.O. Males Salaries £150 p.a. each
- BURY ST EDMUNDS WEST SUFFOLK GENERAL HOSPITAL—H.S. Salary £180 p.a.
- CARDIFF WELSH NATIONAL SCHOOL OF MEDICINE—Temporary full-time Junior Assistant in the Medical Unit Salary £250 p.a.
- CENTRAL LONDON THROAT NOSE AND EAR HOSPITAL Gray's Inn Road W.C.—(1) Third R.H.S. (male) Salary £75 p.a. (2) Second Assistant and (3) Third Assistant for the Outpatient Department
- CHILDREN'S HOSPITAL Hampstead N.W.—R.M.O. Salary £150 p.a.
- COLCHESTER ESSEX COUNTY HOSPITAL—H.P. (male) Salary £150 p.a.
- CONNAUGHT HOSPITAL Walthamstow E.—C.O. (male) Salary £100 p.a.
- COVENTRY AND WARWICKSHIRE HOSPITAL—R.C.O. Salary £125 p.a.
- CROYDON COUNTY BOROUGH—Assistant M.O.H. and Assistant School M.O. (male) Salary £500-£25 £700 p.a.
- DARLINGTON MEMORIAL HOSPITAL—H.S. (male) Salary £150 p.a.
- DORCHESTER DORSET COUNTY HOSPITAL—H.S. (male, unmarried) Salary £150 p.a.
- DUOLEY GUEST HOSPITAL—Second H.S. (male) Salary £120 p.a.
- EAST HAM MEMORIAL HOSPITAL Shrewsbury Road E.—H.S. to the Special Departments and C.O. (male) Salary £120 p.a.
- GREAT BARR PARK COLONY—J.A.R.M.O. (male) Salary £275 p.a.
- HAINSTED GENERAL AND NORTH WEST LONDON HOSPITAL Havestock Hill N.W.—(1) Casualty M.O. and (2) Casualty S.O. for the Outpatient Department, Bayham Street Females unmarried Salaries £100 p.a. each
- HOSPITAL FOR TROPICAL DISEASES Gordon Street, W.C.—(1) Pathologist Salary £750 p.a. (2) Hon Assistant P
- HOVE GENERAL HOSPITAL—(1) Senior R.M.O. (2) J.R.M.O. Males Salaries £150 p.a. and £120 p.a. respectively
- HULL ROYAL INFIRMARY—Second C.O. (male) Salary £150 p.a.
- HULL VICTORIA HOSPITAL FOR SICK CHILDREN—R.H.P. (female) Salary £120
- ILFORD KING GEORGE HOSPITAL—(1) Hon Chief Clinical Assistant to the Orthopaedic and Fracture Department (2) R.S.O. Salary £250 p.a. (3) Medical Registrar Salary £150 p.a. (4) Two H.S.'s Salaries £100 p.a. each Males
- KETERING AND DISTRICT GENERAL HOSPITAL—(1) R.M.O. (2) Second R.M.O. (male) Salaries £160 p.a. and £140 p.a. respectively
- LEEDS GENERAL INFIRMARY—(1) Hon P. (2) Resident Anaesthetic Officer Salary £149 p.a. (3) Junior Resident Anaesthetic Officer Salary £100 p.a. (4) Radio-Surgical H.S. Salary £100 p.a. (5) R.M.O. (male) Salary £200 p.a.
- LEICESTER CITY MENTAL HOSPITAL Humberstone—Locumtenens A.M.O. (male) Salary £10 10s. per week
- LONDON COUNTY COUNCIL—(1) A.M.O.s for mental services Salaries £470-£225-£570 each (2) A.M.O.s (Grade II) to (a) Archway Hospital Highgate N., (b) Mile End Hospital (c) St. Andrew's Hospital Bow E. (d) St. Luke's Hospital Sydenham S.W. Salaries £250 p.a. each Unmarried (a) (b) (c) and (d) are male appointments only. (3) Temporary District M.O. for Area X District H (Woolwich) Provisional salary £250
- LONDON JEWISH HOSPITAL Stepney Green E.—(1) R.M.O. and H.P. (2) H.S. (3) C.O. Males Salaries £150 p.a. £100 p.a. and £100 p.a. respectively
- LONDON UNIVERSITY—University Chair of Bacteriology tenable at University College Hospital Medical School. Salary £1,000 p.a.
- LUTON BOROUGH—M.O.H. and School M.O. Salary £1,000 p.a.

MAIDSTONE WEST KENT GENERAL HOSPITAL—H.S. (male) Salary £175 p.a.

MANCHESTER CITY EDUCATION COMMITTEE—Part time Psychiatrist for Child Guidance Work Salary £500 p.a.

MANCHESTER ROYAL INFIRMARY—Assistant Surgical Dental Officer (non resident) Salary £35 p.a.

MARKET DRAYTON CHESHIRE JOINT SANATORIUM—Resident Locum tenent (male) Salary £6 6s per week.

MIDDOLESBROUGH NORTH RIDING INFIRMARY—C.O. (male unmarried) Salary £150 p.a.

MIDDOLESEX COUNTY COUNCIL—J.R.A.M.O. for Hillingdon County Mental Hospital Uxbridge Salary £250 p.a.

MIDDOLESEX HOSPITAL W—(1) J.M.O. (male) for the Radiotherapy Department. Salary £300 p.a. (2) Whole time Assistant (male) for the Physical Medicine Department Salary £300.

NEWCASTLE THROAT NOSE AND EAR HOSPITAL—H.S. Salary £125 p.a.

NORTHAMPTONSHIRE COUNTY COUNCIL—Temporary Assistant County M.O. (male) Salary £500 p.a.

NORWICH NORFOLK AND NORWICH HOSPITAL—R.S.O. Salary £250 p.a.

NOTTINGHAM GENERAL HOSPITAL—(1) H.S. to the Ear Nose and Throat Department (2) R.C.O. (male) Salaries £150 p.a. each.

OLDHAM COUNTY BOROUGH—R.A.M.O. (unmarried) for the Municipal Hospital Salary £200 p.a.

OXFORD EYE HOSPITAL—H.S. to the Ophthalmic Department Salary £150 p.a.

PLAISTOW MATERNITY HOSPITAL—(1) R.H.S. Salary £75 p.a. (2) Consulting Paediatrician Honorarium £20 and a fee of £2 2s per lecture.

PLYMOUTH PRINCE OF WALES HOSPITAL, Greenbank Road—H.S. Salary £120 p.a.

PRESTON COUNTY BOROUGH—Medical Superintendent (male) to Sharoe Green Hospital Salary £850 £1 062 10s p.a.

PRESTON COUNTY MENTAL HOSPITAL Whittingham—R.J.A.M.O. Salary £500 £25 £600 p.a.

PRINCESS LOUISE KENSINGTON HOSPITAL FOR CHILDREN St Quintin Avenue W—(1) H.S. (male) Salary £120-£150 p.a. (2) Hon Ophthalmic S.

RAOULIN INSTITUTE Riding House Street, W—R.M.O. (male, unmarried) Salary £250 p.a.

READING ROYAL BERKSHIRE HOSPITAL—(1) C.O. (2) H.S. to the Special Departments Males Salaries £150 p.a. each.

ROYAL CANCER HOSPITAL (FREE) Fulham Road S.W.—(1) Non resident H.S. to the Radium Department (2) H.S. Salaries £200 p.a. and £100 p.a. respectively.

ROYAL FREE HOSPITAL Grays Inn Road W.C.—Assistant P.

ROYAL NORTHERN HOSPITAL Holloway N.—(1) H.P. (2) H.S. Salaries £70 p.a. each.

ROYAL WATERLOO HOSPITAL FOR CHILDREN AND WOMEN Waterloo Road S.E.—R.C.O. (male) Salary £150 p.a.

RUNWELL HOSPITAL FOR NERVOUS AND MENTAL DISORDERS—H.P. Salary £150 p.a.

ST BARTHOLOMEW'S HOSPITAL E.C.—Assistant Aural S.

ST PANCRAS METROPOLITAN BOROUGH—A.M.O. for Maternity and Child Welfare Fee £1 11s 6d per session.

SALFORD CITY—Part time Assistant Maternity and Child Welfare M.O. Salary £250 p.a.

SALISBURY GENERAL INFIRMARY—R.M.O. (male) Salary £250 p.a.

SALVATION ARMY MOTHERS HOSPITAL Lower Clapton Road, E.—J.R.M.O. (female) Salary £80 p.a.

SHERBURY ROYAL SALOP INFIRMARY—R.H.S. (male unmarried) Salary £160 p.a.

SIMLA MEDICAL COUNCIL OF INDIA—Secretary Salary Rs 1,200-75 1 500 per mensem.

SOUTHAMPTON ROYAL SOUTH HANTS AND SOUTHAMPTON HOSPITAL—(1) Senior H.S. Salary £200 p.a. (2) H.P. (3) H.S. (4) Resident Anaesthetist and H.S. to the Ear Nose and Throat Department (5) C.O. Salaries £150 p.a. each Males, unmarried.

STIRLING DISTRICT MENTAL HOSPITAL Larbert—Third A.M.O. (female) Salary £250 p.a.

STOCKTON-ON-TEES DURHAM COUNTY MENTAL HOSPITAL—Locum tenent A.M.O. Salary £1 1s per day.

STOKES-ON-TRENT BURSLEM HAYWOOD AND TUNSTALL WAR MEMORIAL HOSPITAL—R.H.S. Salary £175 p.a.

STROUD GENERAL HOSPITAL—R.M.O. Salary £160 p.a.

SURREY COUNTY COUNCIL—Whole time Resident Medical Superintendent (male) for Botleys Park Colony near Chertsey Salary £1 000-£50 £1 175 p.a.

SWANSEA GENERAL AND EYE HOSPITAL—C.O. (male unmarried) Salary £150 £175 p.a.

SWINDON AND NORTH WILTS VICTORIA HOSPITAL—(1) H.P. (2) H.S. Males. Salaries £150 p.a. and £125 p.a. respectively.

TUNBRIDGE WELLS KENT AND SUSSEX HOSPITAL—H.S. (male) to the Ear Nose and Throat Department Salary £150 p.a.

WALLASEY VICTORIA CENTRAL HOSPITAL—J.H.S. (male) Salary £150 p.a.

WEST SUFFOLK COUNTY COUNCIL—Assistant County M.O. and Assistant School M.O. Salary £500-£25 £700 p.a.

WHITEHAVEN AND WEST CUMBERLAND HOSPITAL—H.S. (female) Salary £150 p.a.

WOVERHAMPTON COUNTY BOROUGH—R.A.M.O. (male unmarried) for New Cross Hospital Salary £200 p.a.

WOVERHAMPTON ROYAL HOSPITAL—H.S.s (unmarried) Salaries £100 p.a. each.

WOOLWICH AND DISTRICT WAR MEMORIAL HOSPITAL Shooters Hill F.E.—(1) Surgical Registrar Honorarium £100 p.a. (2) Three Hon Anaesthetists.

WORTHING HOSPITAL—H.S. (male) Salary £130 p.a.

CERTIFYING FACTORY SURGEONS—The following vacant appointments are announced. *Pewsey* (Wiltshire) Redcar (Yorkshire North Riding). Applications to the Chief Inspector of Factories Home Office, Whitehall S.W.1 by May 11.

To ensure notice in this column advertisements must be received not later than the first post on Tuesday mornings.

Notifications of offices vacant in universities medical colleges and of vacant resident and other appointments at hospitals will be found at pages 49 50 51 52 53 54 55 59 and 60 of our advertisement columns and advertisements as to partnerships assistantships and locumtenencies at pages 56 and 57.

APPOINTMENTS

KERR A. K. M.R.C.S. L.R.C.P. Admiralty Surgeon and Agent for St Ives.

ODLUM DONIS M., M.R.C.S., L.R.C.P., D.P.M., Honorary Psychiatrist to Psychiatric Department, Elizabeth Garrett Anderson Hospital, Honorary Senior Psychiatrist to Department for Nervous Disorders Royal Victoria and West Hants Hospitals Bournemouth co-opted member of Mental Hospitals Committee, London County Council.

LONDON COUNTY COUNCIL—The following appointments are announced at the hospitals and institutions indicated in parentheses. *Medical Superintendents* William Gunn, M.B., B.S., D.P.H. (North Western) J. McN. Milloy F.R.C.S. (Archway), H. O. West, M.D. F.R.C.P., D.P.H. (Queen Mary's, Carshalton). *Divisional Medical Officer* R. G. Henderson M.D., D.P.H. (Central Administrative Staff). *Deputy Medical Superintendent Grade I* J. P. Aiken, M.B. B.Ch. (Dulwich). *Deputy Medical Superintendents Grade II* J. C. Evans, M.R.C.P. (Bethnal Green). *Medical Officers Grade I* D. Wilkie, M.D. F.R.C.S. (St Pancras). R. A. V. Lewys Lloyd M.B. B.S., D.P.H. (St Nicholas). *Senior Assistant Medical Officers Grade II* A. Wilkie M.B., Ch.B. (Heatherwood), R. A. Hill F.R.C.S. (St Charles), R. G. Thomas F.R.C.S. (St George-in-the-East), A. F. R. Dewar M.D. (St Stephen's), Elizabeth M. Moore M.B. B.Ch. (Mile End). *Assistant Medical Officers Grade I* J. B. Arthur, M.B., Ch.B. and T. F. R. Griffin F.R.C.S. (Bethnal Green), A. K. Boyle M.B. Ch.B. (St Peter's), T. A. Fraser M.D. (Mile End), G. Melton, M.D. (Lewisham), O. A. Savage M.R.C.S. L.R.C.P. (Grove), J. C. Hogarth, M.B., Ch.B. (Eastern), R. W. Nichol, M.R.C.S. L.R.C.P. (St Charles), J. V. Osborne M.D. (St Mary Abbots), G. Muzels, M.B. Ch.B. (Dulwich), F. R. Leonard F.R.C.S. (St Algece), C. Holson, F.R.C.S. (Lambeth), D. J. Bradley M.B., B.Ch., and Elizabeth B. Kay M.B. Ch.B. (Queen Mary's Carshalton), Margaret F. Coveney, M.B., Ch.B. (White Oak). *Assistant Medical Officers Grade II* D. C. Clark M.B. B.S. and E. Blair M.D. (St Mary Islington), Mary E. Nevin, M.B. B.Ch. (White Oak), Elspeth W. Smellie B.M., B.Ch. (Queen Mary's Carshalton), Kathleen M. N. Vickers L.R.C.P. (Norwood Children's), E. A. E. Palmer M.B. B.Ch. (St Andrew's), Evelyn E. Mitchell M.B. Ch.B. and Katharine C. Rogers, M.R.C.S. L.R.C.P. (St Giles), Mary H. Mayeur, M.D. (St James), H. Baker M.B. Ch.B. and T. M. Smith, M.B. Ch.B. (Bethnal Green), P. G. Dowling M.B., B.S. and P. A. Byrne M.B. Ch.B. (Lambeth), A. L. W. Bell M.R.C.S., L.R.C.P. (Queen Mary's Sidcup), G. Rogers, M.R.C.S. L.R.C.P. (St Peter's). *Temporary Visiting Medical Officer (Part time)* F. R. Martin M.D. D.P.M. (Sutton Training Centre).

CERTIFYING FACTORY SURGEONS—F. E. Higgins M.R.C.S. L.R.C.P., for the Sudbury District (Suffolk). O. Pitt M.R.C.S., L.R.C.P., for the Swinton District (Lancashire).

BIRTHS, MARRIAGES, AND DEATHS

The charge for inserting announcements of Births Marriages and Deaths is 9s which sum should be forwarded with the notice not later than the first post on Tuesday morning in order to ensure insertion in the current issue.

BIRTH

REED—On April 10 at Batu Gajah F.M.S. to Penelope wife of Dr J. G. Reed a son.

MARRIAGE

WHITEHEAD-CHAPMAN—On April 8 1937 at St Paul's Church, Mill Hill James Edward son of the late John Kay Whitehead of Royston Lanes and Mrs Whitehead to Marjorie Beatrix younger daughter of Charles W. Chapman M.D. M.R.C.P., and Mrs Chapman of Highwood Coombe Mill Hill N.W.7.

DEATH

PHILIP—On April 21 at 45 Charlotte Square Edinburgh Elizabeth wife of Sir Robert Philip M.D. F.R.C.P. (Please no flowers).

ENDOCRINES IN THEORY AND PRACTICE

This article is one of a series on Endocrinology contributed by invitation

THE PARATHYROID GLANDS

BY

DONALD HUNTER, M.D., F.R.C.P.

The parathyroid glands are the smallest known endocrine organs in the body. Usually there are four glands, a superior and an inferior on each side but in about 7 per cent of subjects five or six are found, the additional glands being distributed equally between the upper and lower positions. The superior glands are found on the middle third of the posterior border of each lateral lobe of the thyroid, and the inferior glands are placed very close behind the lower pole. About 10 per cent of parathyroid glands are within the thyroid capsule, but it is very rare indeed to find them buried within the substance of the gland. In 22 per cent of subjects one or more parathyroids occur in the upper pole of the main thoracic thymus or its involuted remains but in about only 1 per cent of subjects is the gland actually within the thorax. A normal parathyroid has been found as low as 11 cm beneath the lower pole of the thyroid embedded in the thymus opposite the auriculo-ventricular groove. A normal parathyroid has been observed above the level of the upper pole of the thyroid in the carotid sheath 2 cm below the bifurcation of the common carotid artery.

The colour of the parathyroid glands is pinkish- or brownish yellow contrasting sharply with the deep red brown of the thyroid. The normal glands are always difficult to distinguish at operation. After partial thyroidectomy identification of parathyroid tissue in the thyroid removed is very difficult and an experienced surgeon may prove to be correct only in 5 per cent of cases when checked by histological methods.

In adults over 20 the average weight of the four parathyroid glands together is 132 mg but weights varying from 66 to 388 mg have been recorded. The average size in persons over 20 years of age is 6.5 by 3.5 by 1.5 mm the lower glands being slightly larger than the upper and the female glands rather larger than the male. No normal gland ever exceeds 4 mm in thickness but occasionally a length as great as 15 or even 20 mm is encountered. Corresponding to this elongation the other dimensions of such glands are usually small—that is they are long narrow and thin (Gilmour and Martin 1937).

Histologically two types of cell are readily distinguished—the oxyphil and the principal. There are sub-varieties according to the depth of staining. The two types do not appear to be of distinct origin or nature but rather to represent conditions of special activity. It is not known which cell gives rise to the active substance on extraction of the gland.

The Hormone

The clinical use of the active principle of the parathyroid glands is dependent upon its marked influence on calcium and phosphorus metabolism. Its physiological effects are to raise the blood calcium and lower the blood phosphorus possibly to increase the ionized calcium in the blood and to increase the calcium and phosphorus excretion in the urine. The calcium for this increased

demand comes either from the stores of calcium salts in the bones or from a large amount of ingested calcium salts (Aub, 1929). Parathyroid extract is obtained from the fresh parathyroid glands of healthy domesticated animals used for food by man. The glands are freed from gross fat and connective tissue ground and extracted with hydrochloric acid. The aqueous extract of the active principle is purified to make it suitable for parenteral administration and is sterilized by heating. The preparation is usually sold in 5 ccm vials capped with rubber diaphragms, and containing 100 units in each ccm. The *British Pharmacopoeia* includes no preparation of the hormone.

There is no standard for parathyroid extract and the unit is based on the rise in blood calcium produced by injecting the extract either into normal dogs or into dogs from which the parathyroid glands have been removed. The unit first adopted was defined as one hundredth part of the amount necessary to raise the blood calcium of a dog weighing 20 kilogrammes by 5 mg per 100 ccm. The *U.S.P.* XI (1936) reduced the strength of the unit to one-fifth of its previous potency. The doses referred to in this paper are expressed in *U.S.P.* units. Confusion as to the potency of parathyroid preparations is bound to remain until a standard preparation becomes available. Standardization is being attempted (1) by estimating the rise in the urinary calcium of groups of rats and (2) by employing the awakening effects of parathyroid extract on the narcosis produced in mice by injections of magnesium sulphate (Dyer 1936). These methods involve a comparison of the potency of preparations of unknown strength with those of a standard preparation. The results give promise of a suitable method of preparing a stable powder which may serve as a standard until the pure hormone has been isolated. The following preparations are to be obtained: parathyroid extract—Lilly, N.N.R. (parathormone), parathyroid extract—Squibb, N.N.R., paroidin N.N.R. Parke Davis and Co. and euparitone Allen and Hanbury's.

Parathyroid extract is destroyed in the alimentary tract and is therefore worthless when given by mouth. Some commercial houses manufacture parathyroid tablets but of such firms it may be truly said that their enterprise outruns the discretion of their scientific advisers.

DOSAGE

Like other hormones parathyroid extract has a greater effect when it is needed, thus 75 units a day may be enough to raise the serum calcium from 4.5 to 7 mg per 100 ccm in a case of low-calcium tetany. In normal individuals it may require 500 units a day to raise the level from 10 to 12 mg per 100 ccm. Susceptibility however varies greatly and a dose which will elevate the serum calcium considerably in one individual may have little effect in another. The dosage must be regulated by estimations of the serum calcium repeated every few days until the new level becomes constant. If the doses given are too small this can of course be detected by persistence of the tetany. A serum calcium level above 12 or 13 mg per 100 ccm is never desirable. Since hypercalcaemia gives few clinical indications until a level of about 14 mg per 100 ccm is reached the need for repeated estimations will be appreciated. Where hypercalcaemia persists less

of appetite nausea, and a sense of fatigue appear. Repeated doses of parathyroid extract are more often effective than a single large injection. It is therefore wiser to give the extract twice daily even though the injections may cause some induration and pain.

PARATHYROID OVERDOSAGE

When given in excess parathyroid extract causes the inorganic phosphorus in the blood to rise as well as the calcium. The efficiency of the kidneys is interfered with and nitrogenous waste products accumulate in the tissues. Owing to the large excretion of calcium and phosphorus in the urine renal calculi may be formed, and metastatic calcification may occur in the kidneys, stomach, and lungs. The activity of osteoclasts is increased and this leads to excessive resorption of bone with osteoporosis and osteoclastic (giant celled) tumours. The activity of osteoblasts is also increased but the apposition of new bone cannot keep up with the destruction of old (Thomson and Collip 1932).

TIME RELATION

The parathyroid hormone injected intravenously has a latent period of approximately four hours, after which the blood calcium rises and therapeutic effects begin. These effects last about twenty hours following a single injection. In emergency it must be remembered that calcium salts when injected intravenously exert an immediate effect, which is often prolonged for two hours or more. The chief disadvantage of the parathyroid extract now available is the gradual loss of its effect. After injections have been repeated for several months an apparent immunity is established and then 750 units may have no result in a patient who originally responded well to 50 units. This characteristic limits the use of parathyroid extract to acute conditions in which the treatment is to be continued for weeks rather than for months.

THE PARATHYROTROPIC PRINCIPLE OF THE PITUITARY

It has been reported recently that the urine of patients with hyperplasia of the parathyroids contains a substance which will induce hyperplasia in the parathyroids of normal rabbits. It has also been claimed that parathyroid enlargement may be produced in the rat by the administration of a pituitary extract; this is attributed to a parathyrotropic hormone. Similarly an increase in blood calcium in rabbits has been reported after the administration of a parathyrotropic pituitary extract. The additional claim is made that this is due to the stimulation of the parathyroids since the extract has no effect after parathyroidectomy. It therefore seems possible that the activity of the parathyroid bodies is directly controlled by the pituitary.

Hypoparathyroidism

Parathyroid insufficiency occurs in clinical medicine both as post-operative tetany following operations upon the thyroid or the parathyroids and as spontaneous hypoparathyroidism which is analogous to myxoedema. Both conditions are rare. Parathyroid insufficiency results in lowering of the serum calcium with an associated rise in the plasma inorganic phosphorus, diminished urinary excretion of calcium and phosphorus and the clinical picture of tetany.

TETANY

As its name implies tetany is a condition characterized by a tendency of muscles to go into a condition of painful prolonged spasm. This commonly involves the muscles of the forearms and hands, the larynx, less fre-

quently the muscles of the legs and feet, and even the oculomotor muscles. Sympathetic motor fibres may be involved, resulting in spasm of the cardia, pylorus or any smooth muscle. Sensory nerves are also affected, and paraesthesia of the forearm and hand often of uniform distribution is the most constant symptom of tetany. A similar tingling sensation may be felt in the legs especially in the distribution of the sciatic nerve. In the crises of tetany the patient may complain of girdle sensations of a feeling of a great weight on the chest and of general numbness. The central nervous system may be affected, drowsiness is common and twitchings followed even by convulsions and coma may occur. Even when there are no major manifestations of tetany between attacks the patient may be nervous, self-centred, introspective, difficult to handle, hysterical, emotional, or depressed.

The underlying condition appears to be a decrease in available calcium ions usually associated with a serum calcium level below 7 mg per 100 ccm. The plasma phosphorus figure rises to 5 mg per 100 ccm or higher. There is a diminished excretion of calcium and phosphorus in the urine. Though in severe crises the serum calcium usually is between 4 and 6 mg per 100 ccm, the severity of the symptoms does not vary in proportion to the level of the serum calcium figure. Probably it varies inversely with the number of calcium ions in the body fluids but at present there is no means of measuring this. The symptoms generally become mild or disappear when the serum calcium rises above 8 mg per 100 ccm.

The recognition of tetany is easy during an attack. There is flexion of the metacarpophalangeal joints with extension of the interphalangeal joints, the thumb and little finger being drawn into the palm. There may be flexion at the wrists and elbows and slight pronation of the forearm. The carpal spasm is characteristic and its association with tingling of the arms and sometimes of the legs with or without hoarseness or stridor, completes the picture. The hysterical patient who knows a little about tetany is as a rule unaware of the constancy of the paraesthesia and can seldom reproduce true carpal spasm. The diagnosis can be confirmed by two clinical tests.

1 *The Chvostek Sign*—This consists of twitching of the upper lip or even of one half of the face and is elicited by tapping the facial nerve just in front of and below the ear. It is not an absolute sign of tetany, for it may be demonstrated occasionally in healthy people.

2 *The Trousseau Sign*—This consists of typical carpal spasm brought on by pressure on the upper arm. It is best demonstrated by placing a sphygmomanometer bag on the arm and inflating it to a figure just above the systolic blood pressure. Within a few seconds or up to one minute spasm appears and gradually increases. The spasm becomes very intense in patients with tetany so that the thumb can be separated from the palm only with difficulty. In simulated tetany it is relatively easy to pull the thumb away from the palm and to demonstrate voluntary contraction on the part of the patient.

CATARACT

Lesions of ectodermal tissues may arise in patients suffering from long-standing tetany. Cataract, brittleness and ridging of the nails, loss of hair and defects in the enamel of teeth giving rise to several transverse ridges, one above the other—all these defects in ectodermal tissues have been described in tetany. None of these changes is common but the first is met four times as frequently as

any of the other three. The association of cataract with tetany was first recorded about fifty years ago. It has been described in endemic tetany, post-operative tetany, rickets and spontaneous hypoparathyroidism. It may appear even in young people and may require operative treatment. It is now possible by means of the slit lamp to detect opacities in the lens in cases in which no visual disturbance exists; neither does it follow that such a patient will necessarily develop such disturbance later.

POST-OPERATIVE TETANY

In countries where operations for endemic goitre are common post-operative tetany is more frequently met with than here, but now that radical thyroidectomy is becoming a common practice, especially in exophthalmic goitre, it is probable that more cases of tetany will be seen. Where post-operative tetany supervenes after a subtotal thyroidectomy it usually does so in from one to four days. It is an uncommon complication, and is generally found in patients who have had a previous operation upon the thyroid gland. The patient begins to feel tinglings in the arms and hands on the second or third day. This tends to become more intense and more widespread on the fourth day, when attacks of carpal spasm, perhaps associated with hoarseness or stridor, appear. Between attacks which may last from a few moments to an hour or more the patient suffers from persistent paraesthesia, most marked in the arms, often from stiffness of the hands or mild carpal spasm, and perhaps from hoarseness. In most cases after the initial rather sudden onset the symptoms moderate and gradually disappear, never to return. Here there is probably pressure due to the trauma at the site of operation which together with oedema and blood clot causes temporary interference with the blood supply of the glands. There are, however, severe cases which go on to chronic tetany, and here it is probable that the greater part of the parathyroid tissue has been removed at operation. In the state of chronic tetany paraesthesia is by far the most constant symptom. It becomes worse when the patient is worried or tired. There may be nervousness, lack of energy, weakness and fatigue. Superimposed upon this chronic state of ill health are crises of carpal spasm. Some patients are almost incapacitated by prolonged spasms with severe paraesthesia and hoarseness. In others the symptoms are very mild and the spasms infrequent. In all cases the condition is liable to be reactivated by acute infection, malnutrition, unhappiness or fatigue.

Tetany often arises after removal of a parathyroid tumour in hyperparathyroidism. In some 7 per cent of cases it has proved fatal.

SPONTANEOUS HYPOPARATHYROIDISM

Spontaneous or idiopathic hypoparathyroidism is a very rare disease. It affects persons of either sex and at any age. The onset is gradual, the first symptoms being numbness, paraesthesia, weakness and loss of energy. Later attacks of tetany supervene and the course of the illness is similar to that of post-operative tetany. The serum calcium may be as low as 5 mg. per 100 ccm. and the plasma phosphorus as high as 10 mg. Lenticular opacities may occur and advance to cataracts, blindness (Aldrich and Lippich, 1929).

Differential Diagnosis

Tetany may result from a number of causes including parathyroid deficiency, nutritional disturbances and excess. Most cases met with in this country have nothing to do with the parathyroid. The diagnosis of

parathyroid tetany is easy when the syndrome arises after a subtotal thyroidectomy. Spontaneous parathyroid tetany is to be recognized by the gradual onset of carpopedal spasm associated with a low serum calcium and a high plasma phosphorus. Three disturbances of nutrition may produce tetany—namely, rickets, osteomalacia and idiopathic steatorrhoea. In rickets and osteomalacia characteristic changes in the bones are present, and in idiopathic steatorrhoea the patient passes large fatty stools. The serum calcium is low owing to defective absorption. The plasma phosphorus instead of being high as in parathyroid tetany is low. A large number of cases of tetany are due to alkalosis. In these the serum calcium is normal, but there is thought to be a decrease in available calcium ions. Attacks are usually of short duration, although they may be recurrent. Three types are recognized, and may be diagnosed because of the associated symptoms:

- 1 Following upon over breathing and rapid removal of carbon dioxide this may arise after emotional shock in hysteria and in disease of the upper respiratory tract. It is the commonest form of tetany met with in this country.

- 2 In pyloric or high intestinal obstruction following upon repeated vomiting, with loss of hydrochloric acid, dehydration and alkalosis.

- 3 After overdosage with alkalis especially in the treatment of peptic and chronic gastric ulcer.

Treatment of Parathyroid Tetany

Where the blood supply of the parathyroids has been damaged during an extensive thyroid operation post-operative tetany may occur in an acute form and complete recovery may take place even without treatment. It is the chronic form which may be serious. The patient should be given a diet of moderately low phosphate content: meat, yolk of egg, and milk being allowed only once a day. Often this diet must be supplemented by calcium salts. Calcium lactate can be given with the food in doses up to 60 grains six times daily. The equivalent dose of calcium chloride is 30 grains. Being potentially an acid salt it is more effective in relieving tetany than is calcium lactate or calcium gluconate, which have, however, the advantage that they are less apt to upset the stomach. Many patients are almost completely relieved by calcium administration which forms the basis of all treatment.

In some cases the dose of calcium lactate or chloride may be reduced while the patient continues on a low phosphate diet. In others, while large amounts of calcium salts are taken it may be necessary to give calcium chloride intravenously or to employ parathyroid extract from time to time. In a severe attack of tetany the intravenous administration of 20 ccm. of a 5 per cent solution of calcium chloride relieves symptoms in a few minutes. It is an excellent emergency measure. The solution must be injected slowly and care must be taken that none of it escapes into the subcutaneous tissues for necrosis and ulceration may result. The patient feels a sense of warmth all over the skin while the calcium chloride is being given. The muscles in spasm relax, paraesthesiae disappear and a feeling of greater well-being returns. Although the serum calcium again quickly falls to a low level the patient will commonly feel fairly well and free from tetany for hours and even days after use. If spasms recur the injection should be repeated.

Finally there are cases where so much parathyroid tissue has been damaged or destroyed that the use of the hormone is essential. It is best to inject 30 units of parathyroid extract intramuscularly, repeating the dose

up to twice or even four times daily. At the same time calcium lactate should be given by mouth. In emergency such treatment, because of its slower effect, is not so valuable as the intravenous administration of calcium chloride. But since the blood calcium may remain raised for twenty hours after a single injection of parathyroid extract it is a valuable treatment when severe tetany recurs frequently. Its use should always be controlled by estimation of the serum calcium. Parathyroid extract is an unsatisfactory therapeutic agent to say nothing of its cost. When administered over long periods of time it may become quite inert and when this appears it may be impossible to save the patient. In such a case vitamin D should be given in the form of calciferol, of which very large doses may be prescribed. One patient received more than 30 million units in fifty days, and showed no trace of ill effect. There was prolonged benefit and the blood calcium remained normal for the next three months without any further treatment. A fraction of irradiated ergosterol called A T 10 has also proved valuable in treatment. This fraction does not contain the antirachitic factor, but resembles vitamin D in having the specific effect of raising the calcium content of the serum. The mode of action of this substance is not quite clear, but its effect, though slow in developing, appears to be prolonged. Doses as large as 5 ccm on alternate days have been taken by mouth. Manufacturing firms put A T 10 only at the disposal of clinicians who are able to have serum calcium estimations done regularly, for overdosage may lead to a dangerous hypercalcaemia with metastatic calcification of certain organs. Parathyroid grafting is of no value even though homoplastic transplants be employed.

If there is hypothyroidism thyroid extract should be prescribed in adequate amounts usually 2 or 3 grains a day. It is important that the patient be kept in the best possible state of mental and physical health. Malnutrition, infection, fatigue, worry, unhappiness all aggravate the condition. If foci of infection are found they should be removed when possible. Patients with tetany need interest, increased rest in a quiet environment, adequate sleep and encouragement to continue at work. There is a tendency for the patient to become introspective, discouraged and entirely without hope. Active interest and encouragement on the part of the physician does much to prevent and relieve such mental states and the occasional use of small doses of luminal will help. Perhaps the commonest error in the treatment of tetany is to mystify and frighten the patient and relatives by regarding the condition as grave merely because it is uncommon. In 1861 Armand Trousseau wrote: 'This complaint is in general of no gravity, although it sometimes frightens the patients who suffer from it and misleads medical men who do not recognize it.'

RADIOTHERAPEUTIC DEPARTMENTS IN GENERAL HOSPITALS

MINISTRY OF HEALTH MEMORANDUM

The Ministry of Health has published this week a short memorandum—the seventy ninth of its series of reports on public health and medical subjects—on the provision of radiotherapeutic departments in general hospitals. Sir Arthur MacNalty in a prefatory note states that it was a consideration of the extent to which the existing radium centres supply the needs of the country that suggested the memorandum. It is clear, he adds, that much of the population is still indifferently served in this respect, especially in areas which lack voluntary general hospitals suitable for the maintenance of a treatment centre.

The memorandum, which is written by Lieut Colonel A B Smallman, a medical officer of the Ministry, discusses the provision to be made in hospitals which set out to afford adequate treatment of cancer patients. Such treatment, whether operative or radiotherapeutic, requires the resources of a fully equipped hospital, but owing to the characteristics and cost of radium and of x-ray installations and the need for careful clinical observation supported by physical and biological experiment the addition of radiation as an alternative or supplement to surgery brings with it the necessity of limiting radiation methods to a comparatively small proportion of hospitals.

Economic Size of Hospital for Radiation Facilities

An attempt is made to estimate the number of beds which will ensure full economic use of equipment for the radiation treatment of cancer. In a 100 bed hospital it is considered that about 120 cancer patients will be admitted annually. Of these about 40 per cent will be affected in those organs, such as the uterus, mouth, skin and breast which are most amenable to radiation alone or combined with surgery. Such a hospital would be too small for reasonable use of radiation facilities. A 300 bed hospital intended for what may be called 'acute' cases may be expected to receive yearly about 200 cancer patients affected either in accessible organs or in other situations where irradiation is given with varying degrees of frequency and success and in such a hospital radiation apparatus would be in full and regular use.

In England and Wales (outside London) twenty three general voluntary hospitals have 300 or more beds, of which number eleven possess radium on loan from the Radium Commission and ten have their own stocks, and nearly all of them have deep x-ray therapy apparatus. Of eleven hospitals with 250 to 300 beds, three have radium on loan and five have their own stocks of less than 1/2 gramme; four have deep x-ray apparatus. A number of smaller hospitals have supplies of radium of varying and sometimes quite inadequate amounts.

From the experience of hospitals with about 300 beds it appears that the necessary radiation equipment should consist of about 1 gramme of radium and two or three deep x-ray therapy tubes working at 200 to 250 kilovolts. The choice of radium containers is best left to the clinician concerned and the nature and disposal of the x-ray equipment will again depend upon the views and experience of the officer in charge. With the most

Dr D H Giffen of Enfield has been elected chairman of council of the National Federation of Personal Health Associations. The annual meeting and conference of the Federation will be held at British Medical Association House Tavistock Square, WC, on Thursday, June 24.

¹ Cancer Memorandum on Provision of Radiotherapeutic Departments in General Hospitals. By A B Smallman CBE, DSO MD HM Stationery Office (7d net).

modern types at least two tubes will be necessary keeping in view the probability that the number will need to be increased eventually

Lay out Plants

It is pointed out that the radiotherapeutic department should be an integral part of the hospital rather than a specialized annexe. From the standpoint of diagnosis a close connexion is necessary with the pathological x-ray diagnostic and medical services and from that of treatment with the surgical service. The grouping of apparatus will sometimes be governed by the convenience of the medical and subordinate staff, as for example, when the same person is in charge of both the diagnostic and the therapeutic work. Radiation is used for out-patients as well as in patients therefore it is advantageous for the department to be on the ground floor and with two means of entry and exit one for each of these classes of patients. Another consideration which determines the ground floor is the great weight of the x-ray installation.

In appendices to the memorandum a suggested lay out is given for a new radiotherapeutic department and another for the conversion of an existing hospital ward into such a department. The following points are stressed: the room where x-ray treatment is given should be cross ventilated; it should allow patients of both sexes to be treated simultaneously without being in view of each other by means of curtains and reds a room containing two tubes may be divided into sections so that the two patients can be seen from one observation table. (The new viewing system of spherical mirrors now being constructed at the National Physical Laboratory to enable patients to be kept under observation in such a way that no stray radiation reaches the observer should be of interest in this connexion.) It is recommended that the observation corridor be so placed as not to form an ordinary route from one part of the building to another thus avoiding one cause of distraction to the nurse observer. The power room may be so placed that with a glass partition the nurse may have under observation the electrical apparatus as well as the treatment couch. One examination room should be larger than the others so as to admit of minor surgery and special examinations. A rest room for out patients should be provided. A laboratory for the physicist and another for the making of radium applicators are desirable. The radium safe room should be convenient of access for those authorized to use it and as distant as possible for the safety of patients and staff.

Organization of the Unit

The team or unit would comprise experts in each of the three branches of treatment—operative surgery, radium and x-rays—as well as a radiological diagnostician a gynaecologist a pathologist, a physicist and others. The director would be an expert in one or both radiation methods, and preferably one whose previous experience had been surgical. A follow up system would be established.

The hospitals which have full facilities correspond (excluding London) with the national and regional radium centres, together with the eighteen hospitals recognized by the Radium Commission all are voluntary hospitals in large aggregations of population. How far other hospitals can avail themselves of the provision at these centres must depend upon the number of patients for

whom they cannot provide the necessary treatment, their distance from the centre and other factors. Not all patients need be in-patients during the whole of their treatment, some in whom the disease affects the skin, may not need admission at any stage. An arrangement might be made whereby one member of the unit at the centre hospital visited periodically the affiliated hospitals for consultation as to whether such facilities as they possessed sufficed for the needs of a particular case or whether transference to the centre with its full facilities was necessary. For the detailed discussion of difficulties arising from centralization of radiation treatment reference may be made to a paper by Dr Ralston Paterson.¹

In addition to appendices showing the two lay outs mentioned, the fourth revised report of the British X-Ray and Radium Protection Committee published in 1934 and the instructional code prepared by the Radium Commission on the care and custody of radium are reprinted in the memorandum.

TRAVELLING FELLOWSHIPS IN MEDICINE

The Medical Research Council invites applications for six Rockefeller Medical Fellowships for the academic year 1937-8.

These are provided from a fund with which the Council has been entrusted by the Rockefeller Foundation of New York. They are intended for British graduates who have had some training in research work in clinical medicine or surgery or in some other branch of medical science and who are likely to profit by a period of work at a centre in the United States or elsewhere abroad before taking up positions for higher teaching or research in the United Kingdom. The stipend will ordinarily be at the rate of £400 per annum for a single Fellow and of £450 per annum for a married Fellow. Travelling expenses and some other allowance will be paid in addition.

The Council also invites applications for four Dorothy Temple Cross Research Fellowships in Tuberculosis which are awarded from a special endowment of which the Council acts as trustee. The object of these Fellowships as defined in the trust deed is to give special opportunities for study or research to suitably qualified British subjects of either sex intending to devote themselves to the advancement by teaching or research of curative or preventive treatment of tuberculosis in all or any of its forms. The stipend will ordinarily be fixed at the rate of £400 per annum with travelling expenses in addition.

Completed applications for Fellowships of either type must be lodged with the Council not later than June 1 1937. Further particulars and forms of application are obtainable from the secretary, Medical Research Council, 38 Old Queen Street, Westminster, S.W.1.

¹ *British Medical Journal* December 26 1936 p 1316

The twenty sixth annual general meeting and conference of the British Waterworks Association will be held in London from June 22 to 26 at the County Hall and elsewhere. Lieut-Colonel Harold Will open a discussion on present day aspects of the purification of the London water supply. Professor P. A. Buxton of the London School of Hygiene and Tropical Medicine will describe the work of the Freshwater Biological Association of the British Empire and attention will also be drawn to the problem of prevention of the pollution of rivers. Visits will be paid to various institutions belonging to the Metropolitan Water Board and a demonstration of water purification control methods at the Board's Laboratories has been arranged. A programme of the conference may be had from the secretary of the British Waterworks Association, Grand Buildings, Trafalgar Square, W.C.2.

Reports of Societies

THE BLADDER IN SPINAL INJURIES IN WAR

At the annual meeting of the Section of Urology of the Royal Society of Medicine on April 23 with Mr BERNARD WARD in the chair Sir JOHN THOMSON WALKER opened a discussion on the bladder in spinal injuries in war. He thought it important in view of the possibility of another war, to recall the experiences of the past. Anyone who had to deal with such cases during the war of 1914-18 would agree that the treatment of bladder conditions due to spinal injuries constituted one of the surgical failures.

It was well established Sir John Thomson Walker continued that destruction of the supralumbar cord was immediately followed by complete retention of urine, later the lumbar centre regained its tone and involuntary reflex micturition became established. In a large number of the cases which came under his care these two stages were clearly defined. The duration of the stage of retention varied from twenty-four hours up to in one case eighteen months. There was a transition period during which the bladder was partly distended with urine but contracted and gradually increased in power until the residual urine was small in amount or absent. It was taught before the war that injury or destruction of the lumbar centre and of the cauda equina was followed by complete paralysis of the bladder but experimental work on dogs had shown that the spinal cord could be removed and micturition would return.

Urinary Infection

In a recent paper Mr Geoffrey Jefferson had stated that in the series of cases of injury to the spinal cord under his care no patient who might otherwise have recovered had died of urinary infection. This was in striking contrast to what was found during the war. At the King George Military Hospital from May 1915 to the end of 1916 he examined 339 cases of spinal injury in which bladder function was affected. The cases arrived from fourteen to twenty one days after the injury. The stay in hospital was from one to two months and the patients who survived were drafted to such institutions as the Star and Garter Home, where there were sixty-five beds occupied almost exclusively with cases of spinal injury about 90 per cent of them having serious infections of the urinary tract. Of the 339 patients at the Military Hospital 160 (47.2 per cent) died from urinary infection within six or eight weeks and at the Star and Garter nineteen out of 111 patients (17 per cent) died from the same cause. He estimated that the eventual total death rate due to urinary sepsis in spinal cases was 80 per cent. It was a lamentable tale of surgical failure. Immediately after the injury and before arrival at the hospital the patient was catheterized intermittently and it was septic catheterization which had led to the high mortality. Between the passages of the catheter the bladder became distended with grossly infected urine and the infection passed to other parts of the renal tract.

Methods of Treatment

Some of the methods of treatment to be considered had been tried in the war but the organization was then imperfect, and they were not carried out consistently but were changed according to the whim of the medical officer in charge. During the phase of complete retention the problem was whether the distended bladder should be emptied and if so how while during the stage of periodic reflex micturition the problem was the method of collecting the urine and the treatment of the sepsis if present.

The first method of treatment was non interference. It had been part of the surgical creed that a bladder dis-

tended with urine from obstruction or paralysis must be emptied by the surgeon at the earliest time possible and it came almost as a shock to the orthodox that any doubt as to its soundness should be raised. The spectres that lay behind non-interference were the fear that the bladder might rupture from over-tension or that from too long stretching the muscle might not regain its contractile power. It had been said also that there might be shock from distension of the bladder but this was not so with the slow distension of the paralysed bladder. The effect on the renal structure and secretion however had to be considered and without definite evidence that there was no deleterious effect on bladder function or renal structure and secretion he did not consider the method of non interference one to recommend for universal adoption though at the same time he felt that something of a boggy had been made of the distended bladder.

Next came the method of expression of the bladder contents by pressure or massage. As soon as possible after the injury the distended bladder was gently but firmly compressed and massaged through the abdominal wall with the object of expressing its contents a procedure repeated every four or six hours. In some cases this was quite easy in others difficulties arose. The contraction of the bladder sphincter was an obstacle for which a crop of remedies had been suggested including the giving of certain drugs. Sacral anaesthesia by injection through the sacral hiatus had been tried. It seemed hardly necessary to point out that instillation of anaesthetics into the prostatic urethra or the passage of metal instruments was as dangerous from the point of view of sepsis as the passage of the catheter. If one could accept the statement of some writers this was the safe method in their hands and was successful, but those writers saw only part of the clinical course of the cases. The method was entirely unsuited for cases where serious urinary sepsis had become established. Apart from the danger of rupture of the bladder wall massage of a distended bladder undoubtedly led to regurgitation of septic urine.

With regard to the indwelling or tied in catheter which had been passed at the earliest time possible after the injury and changed twice a week this method if used as a continuous drain had the great advantage over intermittent catheterization that it prevented the recurring distension of the bladder but if used with a clip to evacuate the bladder at a convenient time it was merely a variant of intermittent catheterization. Patients varied greatly in their toleration of the indwelling catheter.

Prophylactic Cystotomy

There remained the method of early or prophylactic cystotomy—prophylactic that is to say, against infection of the kidney not against cystitis. The method he described could be rapidly carried out and in peace time practice ensured a dry patient. He did not think that the objections carried very much weight. It was said to be difficult to get a watertight drainage that cystitis was certain to develop and that drainage of the bladder over any long period practically meant the abandonment of any attempt to establish automatic function. A method of cystotomy had been introduced by Mr Clifford Morson which was even simpler than the one he had practised and slightly modified he thought it would be suitable in these cases.

Of these various methods of treatment of a recently paralysed bladder that of the expression of urine was the simplest and was likely to avoid the urinary infections which caused a high mortality in the late war but more information was wanted as to the method of expression and massage. But he thought there was also a place for early suprapubic cystotomy simplified as it now was and that it should follow immediately on the failure of the expression method and be carried out before the onset of infection not postponed until the fatal train of sepsis was laid. There might be conditions in which it was

superior to the method of expression, but until additional information was available under conditions which admitted of proper management of the recently paralysed bladder the preference as between expression and immediate cystotomy could not be finally decided

Discussion

SIR ALFRED WEBB JOHNSON said that if an authoritative statement could be issued that in spinal injury a catheter should not be passed a great stride would be made towards improving the results. In the late war he succeeded in persuading the Red Cross to erect a hut in which were concentrated twenty such cases of spinal injury. It proved difficult to get hold of cases of virgin bladder for either at the casualty clearing station or in the ambulance train somebody was pretty sure to have insisted on passing a catheter. On the sixty-six cases on which they were able to concentrate both the expression method and non interference were carefully tried out. Neither method was perfect, but each was worth a trial. It soon became evident that the expression method must not be left to a heavy handed orderly and very seldom was to be entrusted to a nurse, it could be carried out sometimes by a well instructed sister. The great differences between bladders were illustrated immediately an endeavour was made to empty by expression, and yet if was possible at one time to walk into that hut of twenty beds and to see at the entrance twenty specimen glasses of urine all perfectly clear and free from infection.

MR KENNETH WATKINS said that it was clear from recent observation that the bladder could not be started working in the same way as movement in a limb for example was started. There was some sort of facilitation within the central nervous system which released the mechanism of the micturition reflex. With regard to urinary infection like Mr Jefferson whom Sir John Thomson Walker had quoted he had not seen a patient who had died from urinary infection but then he had not seen war time cases and there was possibly a difference between these and cases seen in civil practice. He gathered from Sir John Thomson-Walker that the majority of the war time cases were high spinal transections, the majority of the cases he had seen had been cauda equina lesions. MR JOHN EVERIDGE supported Sir John Thomson Walker's views as to the value of primary cystotomy, and described the case of a patient who was shot during riots in Paris in 1934 and on whom cystotomy had been carried out with a favourable result.

Management of the Undescended Testicle

At the same session of the Section of Urology Professor G GREY TURNER gave an address on the place of surgery in the management of the undescended testicle. He said that he had been brought up to believe that in the great majority of these cases it was better to deal with any hernia that was present and to make little or no effort with regard to the testicle. That was an impression still somewhat generally accepted though there was no justification for it. His renewed interest in the subject dated from the publication by Southam of his Hunterian Lecture in 1927 and the effect on his choice of method might be judged from the fact that during the eight years 1920-7 he did no orchidopexies and seventeen castrations, while during the four years 1929-32 he did twenty four orchidopexies and four castrations.

John Hunter stressed the underlying problem in his *Animal Economy* when he wrote "It is not easy to ascertain the cause of this failure in the descent of the testicle but I am inclined to suspect that the fault originates in the testicles themselves—a view commonly held at the present time. There was a good deal of evidence for the truth of both the following propositions: the testicle does not descend because it is not sufficiently developed; the testicle does not develop because it has not descended. From his own experience he was satisfied

that if a testicle was going to descend of its own accord after birth then it would almost certainly do so during the first three years of life. He was very sceptical of cases that came down after that period. In a good many cases in all probability the testicles were lying in the inguinal region, and the case was not one of non-descent but of ectopia.

Professor Grey Turner went on to show photographs of the after-results of some cases. One case was that of a man who had a double orchidopexy sixteen years previously and was now at the age of 31, already the father of three children. In some cases the results were not so satisfactory and it was on these relative failures that he chiefly dwelt. If the testicle could be got into the scrotum and be quite mobile it was almost certain that the testicle would develop but there were cases in which, even when the testicle was satisfactorily placed in the scrotum development did not come about. Such failures were not common but it was well to have the possibility in mind.

Age for Operation

As to the age of election for surgical intervention in these cases it was generally held that if the operation took place fairly early and the testicle was brought into the scrotum it had a better chance of development. He was not sure however that that was entirely correct. He thought that on the basis of what was known already of the results of hormone treatment the optimum age for which was probably about 9 that a patient would suffer in no way if the operation was deferred until he was 10. Perhaps the age 10 to 14 was the optimum time for surgical intervention. Surely it was just before puberty that the testicles like the other genital organs were ready for an outburst of activity and were more likely to develop.

If an associated hernia was giving trouble it was necessary to intervene but he was not sure they were wise in interfering merely because there was a hernia. If the hernia were left alone to develop up to the optimum time for carrying out the operation then probably the presence of that hernia and the gradual distension of the sac would encourage the descent of the testicle and might even have something to do with encouraging the testicle in its subsequent development. He had very little confidence in repeated operations for undescended testicle. The patient's best chance lay in the first operation. A second operation was not carried out with anything like the same facility or prospect of success.

If there was any special reason for doing so there was no objection in his opinion to operating very much later and he had even operated with great success on young men between the ages of 18 and 24. But at later ages, if one testicle was fully developed it was much more sensible to recognize that it was not worth while interfering too much. One fully developed testicle was enough and one should not be too particular about excising a testicle associated with a hernia when the prospects of its functioning seemed to be poor.

Association with Hernia

As for the association with hernia which had such a large bearing in determining the earlier operations although it was recognized that hernia was quite common with undescended testicle he did not think it was so common as might be supposed from the textbooks. At operations although a sac was found which was rather like a glorified tunica vaginalis he had often failed to demonstrate whether it was a hernial sac or not. The mobilization of the testicle was a most important thing but it was not the only important thing. He was really more than he had done in the past that possibly the methods used for fixation were though not equally important yet of great importance. He described with drawings how he had made a kind of scrotal bed on the affected side, and passing the suture through the body

of the testicle and through the scrotum had sutured to the thigh. He was satisfied that unless the mobilization was so good that one felt that the gland would lie in the scrotum even without fixation, the probability was that there was not enough fixation and that some other method should be adopted. The testicle in a pouch in the thigh would often develop completely and the result be extremely satisfactory.

Finally, Professor Grey Turner made a plea for more careful recording, and showed a suggested form of record. Surgeons in this field had analysed their results as comprising a satisfactory outcome in between 70 and 80 per cent of cases and failure in between 20 and 30 per cent. If the cases were likely to be helped by endocrine therapy this should certainly be undertaken.

Discussion

Mr McADAM ECCLES suggested that the term undescended testicle be avoided. An undescended testicle was one which was close up by the kidney—an abnormality occasionally seen but exceedingly rare. The imperfect migration of the testicle was the more common occurrence, and that was the subject of the discussion. He ventured to prophesy that if only the definite cause of non migration could be discovered surgery might be cast aside and the cases wholly given over to the endocrinologist. In surgery those interested in this subject had all deplored their failures. It had not always been recognized that it was one and the same cause—possibly a cause associated with the endocrines—which prevented both migration and development. In other words, there was not one cause for non migration and another cause for non development. In the cases in which he had had failure in the past he had not always put it down to his imperfect technique but rather to the fact that he was not dealing with the real cause which lay behind the non descent. He was quite sure that a real investigation of these cases would assist more than anything else in their better treatment in the future. Medical officers of public schools had special opportunities of carrying out these investigations.

Mr T W MIMPRISS gave particulars of operations for imperfectly descended testicle carried out at St Thomas's Hospital chiefly by the Keetley technique or some modification thereof. Good results had been achieved in about 90 per cent of cases—a good result meaning a testicle brought well down in the scrotum. A certain number of cases which had been admitted but not operated on had shown a spontaneous descent at about the age of 11 or later and he thought that was not very unusual. Since then he had written to the medical officer of a public school who dealt with boys aged 13 and over and he gave it as his opinion that the majority of undescended testicles came down spontaneously. That however was rather difficult to accept. He believed the only result of hormone treatment was to bring down testicles which if left alone would come down of their own accord.

Dr RONALD SMITH, medical officer of Rugby School gave particulars of a number of cases of imperfectly descended testicle including a group of boys aged from 7 to 13½ in whom the testicle had descended without any treatment whatsoever. He thought it was justifiable to say that at puberty there were certain biological changes going on which induced the testicle to descend. Every boy should be left until he reached puberty and then, if the testicle was not descended he should be given hormone treatment and if that did not avail surgical advice should be taken as to whether adhesions were present or not. In the group mentioned all the testicles which had descended spontaneously seemed to be normal save in one case in which a boy with an undescended testicle on reaching to a high shelf felt a sharp pain in his groin and it was then found that the testicle had descended, but was much smaller than the other. Pro-

fessor GREY TURNER suggested that with the help of school medical officers something in the nature of a communal census might be very useful on this subject.

FUNGUS INFECTION OF THE FEET

At a meeting of the United Services Section of the Royal Society of Medicine on April 12 Surgeon Commander J C SOUTER read what was described as a clinical note "but was in reality a comprehensive paper on fungus infection of the skin of the feet."

Surgeon Commander Souter said it seemed to be generally supposed that this disease had been recognized only since the war but Whitfield described 'ringworm of the toes' as long ago as 1908. No doubt the disease had become much more prevalent since the war and this might tentatively be put down to two factors—namely the conditions of trench warfare and the service of so many men in tropical and subtropical countries who on their return home disseminated the disease. The disease could no longer be regarded as one of hot countries but was of world wide incidence. The consensus of opinion was that fungus infections of the feet were commoner in the higher strata of society, they had been shown to occur in hospital cases though the speaker had seen very few instances while attending the practice of one of the skin hospitals in London.

Ætiological Factors

By far the most common types of fungi found were those belonging to the trichophyta, epidermophyta and endodermophyta groups. Fungus growing anaerobically in the skin in the form of a network of mycelial threads had both a corrosive action by the elimination of a keratolytic ferment and an irritant action producing inflammation owing to the toxic influence of the ferment and rapid growth of the fungus itself.

For the soil to be rendered favourable for the growth of the fungus two factors heat and moisture seemed to be necessary. The predisposing factor of excessive sweating in the causation was generally accepted and one authority had shown that it was necessary to produce maceration before experimental lesions by inoculation. Tight fitting badly ventilated modern shoes tended to produce excessive heat and moisture and cause maceration and devitalization of the skin between the toes giving ideal conditions for the growth of fungi. Trauma however slight seemed to be necessary for the fungus to gain an entrance and this might be effected by particles of sand while bathing or wading or by the action of caustics on the bare feet of sailors while cleaning the decks. In the author's experience the intertriginous type was by far the most common, while the hyperkeratotic type was comparatively rare. The intertriginous involvement represented the primary lesion in practically all cases.

Although the diagnosis might have to be made on clinical grounds alone it could not be regarded as final unless the fungus had been seen on microscopical examination of scrapings and indeed not until a true pathogenic fungus had been demonstrated by cultural methods. Cases of simple true systemic dysidrosis were often diagnosed as fungus infections. In this condition non inflamed deep uniform sago grain like vesicles sprang up at once symmetrically in dozens or hundreds. They burned rather than itched and seldom ruptured spontaneously.

Treatment

Fungus diseases of the skin of the feet were extremely difficult to cure and very liable to relapse or recur. They had been treated by almost every conceivable agent from kerosene to chiropractic. The general health of the patient should not be forgotten particularly in the more severe cases, and cure could be hastened by the use of

tonics containing iron strychnine and Fowler's solution. A generous diet with a high vitamin content should be given. Secondly infected patients with lymphangitis or cellulitis should of course be kept in bed and the infected feet treated on the usual lines with boric acid fomentations eusol soaks and boric starch poultices and the like, until all signs of the secondary infection had disappeared. Presuming that the lesions were no longer inflamed, a remedy or combination of remedies with fungicidal or at least fungistatic and keratolytic action must be employed. He had not found powders of great value in therapy and preferred to treat the intertriginous variety with a combination of paint by day and ointment by night and the vesicular variety with a paint after opening all the vesicles with a sterile needle changing to an ointment if the lesions became eczematoid or scaly. The hyperkeratotic type of lesion reacted best to pastes while fissures required special treatment.

Discussing some of the more common remedies used in treatment Surgeon Commander Souter said that the best known preparation was Whitfield's ointment so often wrongly prescribed. The correct prescription was as follows:

R. Acid benzoi	grains 25
Acid salicyl	grains 15
Paraff mollis	dr 2
Olei cocois nucis	oz. 1

Hard paraffin, 15 grains should be added in hot weather. In all intertriginous cases except when gross maceration was present, and in scaly or eczematoid lesions elsewhere he used Whitfield's ointment or the preparation mycozol as the treatment of choice. After mentioning other preparations he said that the success which had followed x-ray treatment of scalp ringworm had given rise to an impression that this method could be used for treating other forms of ringworm as well. It was forgotten that x-rays did not kill the ringworm fungus but simply brought out the affected hairs. X-ray treatment was not a rational therapeutic measure in this field. He also touched on prevention, general and individual, saying that the main factor in prevention was to render the site unsuitable for the fungus.

Dr G. RONIE HALL mentioned that at Lagos some forty years ago civilian Hausas were treated for what was then known as *anum* described as a circular rodent ulcer around the base of the little toe. Sometimes the whole of the ligaments around the metacarpophalangeal joint were exposed and the people came for removal of the moribund toe. One point was that these were sandalled people and the ulcer was always fouled with sand. Those who suffered in this way were often newcomers to the territory and had undergone a change of diet.

EPITHELIAL TUMOURS OF THE BLADDER

At a meeting of the Pathological Society of Manchester on April 14 with the president Dr T. H. OLIVER in the chair Dr I. A. B. CATHIE and Mr K. H. WATKINS presented a preliminary report on the epithelial tumours of the urinary bladder.

Dr Cathie discussed the histological findings in the eighty-four cases which had been examined. Many of the tumours were subjected only to biopsy, the tissue being removed with the flexible cystoscopic rongeur forceps. Others were examined after operative removal with or without previous biopsy. Cytological variations alone could not be accepted as evidence of malignancy; invasion being the only criterion on which malignant change could be established. Malignant tumours of the bladder were classified into three groups—malignant papilloma, papillary carcinoma, and infiltrating carcinoma—according to the morphological structure as observed microscopically. These tumours were also graded cytologically according to the method of Broders. A distinct parallelism was found

to exist between the various groups and the cytological grading. Thus a benign papilloma would usually be graded '1' or at the most '2', whilst at the other end of the scale infiltrating carcinoma was usually graded '3' or '4' or occasionally '2'. In the case of biopsy it was necessary to correlate the histology with the clinical (cystoscopic) findings, since the same tumour might show a benign structure at one part and malignant change at another.

Mr Watkins described some of the characteristics of tumours of the bladder and remarked especially on the frequency with which tumours originate or recur on the vesical orifice itself and even in the posterior urethra, the high incidence of metastasis, and the tendency to cause obstruction at the bladder neck or lower ureter leading to death from uraemia. The difficulty of differentiating benign and malignant tumours by naked-eye examination had been stressed by many writers, notably Albarran and Geraghty. Malignant changes could be found in tissue removed by biopsy from the surface of a tumour and about 50 per cent of pedunculated tumours showed malignant change.

Surprisingly enough, those with tumours infiltrating the bladder wall graded '2' had lived little if any longer than those with similar tumours graded '4'. It was concluded that cytological grading alone was not an estimate of the danger threatening the life of the patient. Since areas of benign papilloma might be found in a malignant tumour a single biopsy report must not be allowed to mislead but repeated biopsy examinations might be expected to reveal the diagnosis. Biopsy was a valuable addition to the information derived from the clinical and cystoscopic examination.

Local News

ENGLAND AND WALES

Lord Moynihan of Leeds

The March issue of the *University of Leeds Medical Society Magazine* takes the form of a richly illustrated Moynihan Memorial Number. An editorial foreword says: 'In selecting extracts from his papers, lectures and speeches we have endeavoured to convey something of the magnetic personality of Moynihan and to create as far as possible the atmosphere which was so essentially associated with the man rather than to record a mere historical list of facts.' The text of Dr T. Wardrop Griffith's broadcast on September 7, 1936, is followed by a biographical sketch signed R. E. T. Sir David Wilkie contributes an article on Lord Moynihan's place in British surgery and Dr William J. Mayo an appreciation. Mr C. Oldfield writes on 'The Man' and Mr L. R. Braithwaite and Mr E. R. Flint on 'The Craftsman'. Mr E. W. Hey Groves and Dr W. Cuthbert Morton recall Moynihan as editor and as orator and writer. The story of the Moynihan Chirurgical Club is told by Mr E. Finch of Sheffield. Seventy-eight pages are given up to extracts from published works, letters, speeches and addresses, and a comprehensive bibliography. The illustrations include many portraits, two of them in colour, a photograph of the great surgeon's hands, and a facsimile letter written by him on April 30, 1936, to his old friend Dr Hawkyard.

Royal Surgical Aid Society

For seventy-five years the Royal Surgical Aid Society has provided well over a million patients with urgently needed surgical appliances, and for the past thirty-five years it has enjoyed Royal patronage. In the ordinary way a patient must first obtain a surgeon's certificate and must then collect from subscribers to the Society's funds a

specified number of letters of recommendation—an annual subscription of half a guinea or a life subscription of five guineas entitling the subscriber to two recommendations per annum these numbers of recommendations increasing in proportion to the amount of subscription or donation. But in order to mark the year of the King's Coronation the committee is prepared to issue double the usual number of recommendations in respect of all special "Coronation donations" during the month of May. This means a corresponding increase in the number of those whom the society can help. The number of deserving applications is always far in excess of what can be dealt with. Last year 27,156 patients obtained help, and the appliances supplied totalled 35,263. So inundated was the society with requests from Durham and other distressed areas that a special fund was created to deal with them and a successful appeal was launched enabling special grants to be made to all authorized cases from these areas. Perhaps the most valuable aspect of the work of the Royal Surgical Aid Society is that it not only relieves much suffering and distress but enables people who would otherwise be chronically handicapped to lead normal and useful lives. Not only in the distressed areas but in the great L.C.C. housing estates springing up around London are fresh fields where surgical equipment is desperately needed. To meet these demands an appeal for further support is made.

Propaganda for Health Services

It was reported to the London County Council on April 27 that the Minister of Health had communicated with Lord Snell, the chairman of the Council, stating that he was impressed with the importance of making the health services throughout the country better known to the public in order to encourage their fuller use and that the suggestion had been made that the efforts of local authorities in this direction should be supplemented by a national campaign. The Minister, with the support of the President of the Board of Education is arranging for a publicity campaign to be carried out in the autumn. The Government finding the money for the provision on a generous scale of posters, leaflets and other material. The Minister is endeavouring to enlist the co-operation of local authorities. In London the field of administration covered by the campaign is very largely the concern of the metropolitan borough councils and he has addressed letters to the mayors of the boroughs. He asked for the co-operation of the L.C.C. which it expressed its willingness to give. One sentence in the Minister's letter read that while it is agreed that the health services of the country are probably unrivalled, there can be no room for complacency so long as it is true that in the country generally they are not being used to the fullest extent by those for whom they are provided.

An L.C.C. Hospital Handbook

The Public Health Department of the London County Council has issued a neat pocket size handbook containing particulars of the Council's general and special hospitals and the ancillary services. A section is devoted to each hospital and includes such details as the names of the principal staff, the bed accommodation and special services, statistics, the telephone number and the route. One recent development is the appointment of almoners at twenty-eight of the general hospitals. Particulars are also given of the affiliation of seventeen of the Council hospitals with eleven of the medical schools. The compilation will be a boon to London practitioners. One detail which might perhaps be added in future editions is the days and hours of the clinics and outpatients departments. The special units at some of the hospitals make a remarkable list. Hammersmith for example in addition to the more usual services has a metabolism

department, an oxygen therapeutic service and a dietetic kitchen. The special units at the general hospitals now number seventeen: there are diabetic clinics at three hospitals and psychiatric out-patient clinics at three; eight hospitals are furnished with electrocardiograph apparatus and fifteen oxygen tents are available for the general and special hospitals. The staff of these hospitals and institutions includes 368 medical officers apart from consultants, 253 consultants, 10,540 nurses, 90 pharmacists, 44 radiographers and 113 masseurs and masseuses, while the pathological services employ a medical and technical staff of about 100. A useful hospital map of the county is appended.

INDIA

Madras Hospitals and Dispensaries

The number of civil hospitals and dispensaries in the Madras Presidency increased in 1935 by seven, there being at the end of that year 1,116 working in rural areas and 247 in towns. There was an increase also in the total of in-patients by about 6 per cent. In his annual report for that year Lieut. Colonel Newcomb, I.M.S., officiating surgeon with the Government of Madras, announces with satisfaction the growing tendency of women to come to medical institutions for maternity relief. In 1935 90,910 normal and 15,913 abnormal cases of labour were conducted in them. Thirty-one new antirabic centres were opened in the Presidency and twenty-one medical officers received special training at the Pasteur Institute at Coonoor which records that for the third time in its twenty-nine years there were no deaths. The Paris fixed virus was in use throughout the year, and was in its 95th passage at its termination. Patients treated in the Institute numbered 535 and at the local centres in Southern India 14,084. There were twenty deaths in these centres from rabies of which fourteen occurred among the completely treated—a mortality rate of 0.11 per cent. The shortest incubation period was thirteen days and the longest 231 days; there were no post-treatment complications. The total number of doses of antirabic vaccine issued was 192,269 as compared with 169,106 in 1934. Steady progress was made in the Presidency in the leprosy campaign: thirty-six new clinics were opened during 1935 but still more are required by subsidized rural dispensaries. The clinical results were better than before in those patients who persevered with treatment and enthusiasm is consequently growing among the medical practitioners as well as among the patients. The new pathology block in the Medical College, Madras, was completed and occupied during the year. The total number of surgical operations in all institutions was 602,304, with a percentage death rate of 0.27, as compared with 0.28 in the preceding year.

Child Welfare in Agra and Oudh

Dr K. L. Chaudhri, director of public health for the United Provinces of Agra and Oudh, devotes part of his report for the year 1935 to the progress made in school medical inspection and emphasizes the importance of treatment clinics. It has been found from the experience of central school dispensaries in Agra, Allahabad, Cawnpore, Benares and Lucknow that in addition to the provision of treatment facilities for removal of defects of a routine nature the clinics afforded opportunities of paying attention to the conditions which needed an educational treatment for follow-up work. From the clinic records it was possible to check up the results of treatment of the defectives who had been sorted out at the medical inspections, and thus to systematize the subsequent work of supervision and treatment. Boys with defective vision received attention which could not otherwise have been given without considerable interference with their work, while those from very poor families were supplied with glasses free of cost. Patients with defective teeth and

gums were suitably advised and treated. Boys coming from the rural areas appeared to have better teeth as a rule, the incidence of pyorrhoea being much higher in urban areas where also the prevalence of enlarged tonsils was more marked. The records showed that considerable manifest improvement followed this careful examination and treatment especially in urban areas, where the incidence of mouth breathing was reduced from 32 to 1 per cent., the same level as that in rural areas. The school dispensaries also served as a sorting-place for reference of cases to specialists in hospitals. It is added that the most necessary lines of advance in maternity and child welfare work in the provinces of Agra and Oudh are the education of the public, particularly of mothers, in health matters and the training of indigenous dais in clean and normal midwifery, the last-named activity having been undertaken on a large scale. Maternity boxes have been distributed to many successfully trained candidates. The maternity and child welfare work, apart from the school medical work, is purely an activity of the Indian Red Cross Society but is controlled by the director of health. One child welfare and three new maternity centres were opened during the year under review but there is as yet no Red Cross maternity hospital in the United Provinces. Public instruction is given on such occasions as exhibitions and fairs and other forms of propaganda work are actively conducted. General improvement of the health standards of the child population is discernible.

Correspondence

Anaesthesia for Perineal Tears

SIR—In the *Journal* of April 10 (p 753) Dr Stanley Way advocates the use of local anaesthesia for the repair of torn perineums. In 1928 (*Lancet* I 1281) I described a similar method in a short article entitled 'A Note on the Immediate Suture of the Perineum under Local Anaesthesia'. The only difference between my method and his is that I add one drop of a 1 in 1000 solution of adrenaline chloride to each drachm of novocain, and use a 2 per cent. instead of a 4 per cent. solution of novocain. The method has been in continuous use in both the indoor and the outdoor practices of the Obstetric Unit, University College Hospital for the last ten years and has given satisfactory results. As in Dr Way's method the hypodermic needle is introduced through the raw surface and never through the skin. We find that the introduction of the hypodermic needle is painless if a swab soaked in the novocain is first laid against the raw surface for ten minutes.

I consider that an anaesthetic of some kind is always necessary for the proper repair of torn perineums that a general anaesthetic is not necessary and that even in hospital it adds very materially to the risk of labour—I am, etc.,

London W.C.1 April 20

F. J. BROWNE.

SIR—With reference to Dr Stanley Way's note on the repair of the torn perineum (*Journal* April 10 p 753), I should like to point out that perineal tears can be repaired under the analgesia produced by chloroform brisettes. There is no need for the practitioner to give the anaesthetic while the midwife repairs the tear for these crushable capsules of twenty minims of chloroform can be quite safely administered by the midwife. I am still of the opinion that the use of these crushable capsules is the most practical way of giving relief in the majority of labour cases not dealt with in hospitals—I am, etc.,

London April 25

W. D. HAYWARD M.B., B.Ch.

Hermaproditism

SIR,—Mr Harold Chapple's article on his 'female man' in the *Journal* of April 17 (p 802) is of such interest and importance that I hope he will be kind enough to elucidate certain further details.

I take it by implication that the three examinations of the pelvis which were carried out thoroughly while the patient was anaesthetized were performed through the (pseudo) vagina. The following questions occur to me:

1. Has the pelvic cavity in this case ever been examined through an abdominal wound? If not—

2. In what percentage of parous women can an experienced gynaecologist detect the ovaries per vaginam?

3. (The corollary.) Would the failure to detect an ovary per vaginam in a woman with a normal vagina lead to the conclusion that ovaries are absent?

4. Would the shortness (3 in.) of the (pseudo) vagina in this case at all impede thorough examination of the pelvic cavity?

5. How often has the coexistence of testicles and ovaries been recorded?

6. Are extrapelvic ovaries ever found?

7. How would the discovery of ovaries in Mr Chapple's patient affect his theoretical conclusions?

8. I do not grasp the purport of the following sentence: 'Indeed it appears to me simple to deduce that the superior intelligence of the female is the result of her physical disadvantages. Does simple here mean foolish or easy?' Is the intelligence of the female superior to that of the male? Is this a scientific fact or a personal opinion?

9. In what obvious way are homosexual practices damaging to the herd in which we live? I doubt whether the law should have any jurisdiction over homosexuality except to prevent its commercialization.

In the case described by Mr Chapple there are three possibilities:

(a) The patient is a female and the question of homosexuality does not arise, or (b) the patient is a male and comes under the shadow of the law and the gynaecologist by lengthening the (pseudo) vagina is implementing a homosexual practice, or (c) the sex is indeterminable in which case there is no basis to deal with these problems legally.

So important are the issues raised by Mr Chapple's article that I hope he will forgive this inquisition—I am, etc.,

Beaminster Dorset, April 20

R. E. HOPE SIMPSON

SIR—In the *Journal* of April 17 Mr Harold Chapple (p 802) describes a case which he rightly considers to be of considerable importance in having a direct bearing on the problems of sex, its origin, and manifestations. His communication is of such importance that I feel a certain diffidence while admiring the presentation of his case, in criticizing his conclusions.

How does Mr Chapple know that his patient "has no ovarian secretion"? Only one of the lumps was microscopically examined. We do not know of what nature the other one was. Moreover even the normal 100 per cent. male produces an oestrogenic hormone. In saying that the woman had never possessed ovarian tissue at all I feel sure that Mr Chapple goes beyond his observed facts. In his last paragraph he displays a stern morality which suggests that to the scarlet gown of the doctor he has added the crimine tippet of the judge. Even supposing that he is right in saying that his patients produce only male hormone he can hardly uphold in the present state of our knowledge his view that the behaviour of homosexuals "should not be regarded as justifiable on the ground of these glandular secretions, nor should it be held that it is

Research in Mental Hospitals

SIR,—In an annotation on London's mental hospital service in your issue of April 24 (p. 872) Dr Golla is quoted as follows: 'The work (of research) continues to be patchy in its distribution and in certain institutions there is a spirit of inquiry among the medical staff that is lacking in others with equally good facilities for investigation.'

In spite of the recent substitution of the term 'mental hospital for asylum' the primary purpose of these hospitals remains the same—the treatment care and comfort of persons of disordered mind. According to authoritative opinion and modern conceptions of mental hospital practice and treatment such hospitals are still grossly understaffed. Such staffs as are available have as much as they can do in tackling the minimum basic routine of clinical surgical and other work that is necessary for the patients. Such work we venture to say is of a wider range and of a higher quality than the average general practitioner is in a position to carry out. In confirmation we need only refer to an editorial in the *Lancet* of July 18 1936 under the heading 'Medical Staffing in Mental Hospitals'. In view of this fact we suggest that such research can only be carried out at the expense of the patients' welfare. It would be interesting and not difficult to investigate whether the standard of routine treatment is not in fact higher in hospitals where such research does not flourish. Some of us, incidentally, question the value of much that passes for research. Too often it would seem to add more to the researcher's chances of promotion in the eyes of promoting bodies who have been bitten by the research bug than to mental science. In any case until the staffing of mental hospitals becomes more adequate to modern needs we would suggest that we must devote our energies to the primary purpose of the mental hospital—treatment of the patient. We might usefully leave research great though our interest in it be to those psychopathic hospitals that are suitably staffed, equipped and constituted for the purpose.—We are etc.

Why "Nocifensor"?

SIR—I thank Lucifer and Peter Shaw for their good humoured replies to my letter, but must not waste your space which I might do extensively by discussing the words they refer to. My knowledge of the classic languages is only moderate but it suffices to fill me with respect for them: their exquisite scientific structure appeals to me as a scientist and considering what our language owes to them I am ashamed of the outrage which is persistently done by the invention of barbarous compounds.

I hold that the Latinist would have used the stem *nocui-* in compounding with *-fensor*. He would not have pronounced it in the English way, for the short *u* in Latin had an obscure sound perhaps resembling that of *u* in *locum* pronounced as in English. Neither would he have pronounced *nocifensor* in the English way. In any case if we pretend to derive new terms from the classical languages we should take care to be sure of our methods.

—I am etc.

Shepton Mallet April 23

Obituary

JOHN LUKE JACKSON, M.B.

Dr John Luke Jackson, medical superintendent of Knowle Mental Hospital, Fareham Hants, died on April 5. He was a son of the late Rev John Jackson, D.D. of Ballycastle, and studied medicine at Queen's University, Belfast, graduating M.B. B.Ch., and B.A.O., with honours, in 1910. After a hospital post and a short period in general practice he was in 1912 appointed as a medical officer at Knowle Mental Hospital. At the outbreak of war he volunteered for the R.A.M.C. and saw service in France, Egypt, and Gallipoli. He was for a time a prisoner of war in Germany. He was twice mentioned in dispatches, was awarded the French Croix de Guerre in November 1918 and attained the rank of major. In 1922 he became medical superintendent of Knowle Mental Hospital, and in 1931 was appointed principal medical adviser to the Hants Joint Mental Health Institutions Committee. Dr Jackson was a member of the Royal Medico Psychological Association and joined the British Medical Association immediately after graduation. At the Annual Meeting in Portsmouth in 1923 he was honorary secretary of the Section of Neurology and Psychological Medicine.

Dr W. H. Lamplough writes: The members of the Medical Golfing Society will hear of the death of John Jackson with deep regret. He was a member of the society for the last fourteen years and rarely missed a meeting where his obvious friendliness, sense of humour and boyish enthusiasm made him many friends. No day was too long for him, and at these moments of general relaxation from the cares of our profession his gaiety was infectious to all. He had been a member of the Hayling Golf Club since 1919, and a most capable captain for three years. He was a past holder of the Hampshire championship. A man of quick and courageous decisions, he was a born administrator, and as medical superintendent of Knowle Asylum and in charge of mental clinics throughout the county he had ample opportunity for exercising his undoubted talents and unbounded energy. Less than three weeks before I wrote these lines he was among us in apparently the best of health and spirits, happy in his work and play and devoted to his family. His passing will be a sad loss to many, as it is given to few to command the affection of his fellow men to such a high degree as did John Jackson.

The sudden death from pneumonia of Dr ROBERT ANDERSON jun., of Erdington, Birmingham, at the early age of 33, has come as a sad blow not only to his family but to a wide circle of patients, colleagues, and friends. Anderson left Repton School to study medicine at Trinity College, Cambridge, at Birmingham University, and at the Rotunda Hospital, Dublin. He qualified with the B.Chir. and M.R.C.S. L.R.C.P. and gained the Senior Clinical Medical in Obstetrics at the Birmingham medical school. Seven years ago Anderson joined his father in practice in Erdington after having held resident posts as house surgeon, house physician and obstetric house surgeon at the Birmingham General and Queen's Hospitals. His career was one of great promise (writes H.F.). When at Cambridge he was a keen member of First Trinity. He followed up his experience in the Cambridge University O.T.C. by taking a commission in the R.A.M.C. (T.A.) and attained the rank of captain. His personal qualities were of an exceptionally high order. He was an indefatigable worker and even as a young man his attractive personality and his capacity for sym-

pathetic understanding of the patient's point of view quickly established him as an exceedingly valuable practitioner. When he entered the old-established practice, which had been carried on by his father for thirty years, Anderson was already well known in the district, and he speedily attained a leading position. In the 48th (South Midland) Divisional R.A.M.C. his work was distinguished by enthusiasm and by soldierly qualities of ability and self-reliance. In the efforts which have been made during recent months to bring the Territorial Army up to strength and to encourage a high standard of efficiency Anderson has been untiring. To his widow his mother, and his father we add our tribute of sympathy to those which have already been accorded by many from all sections of the community in Birmingham and elsewhere.

Dr ROBERT LYALL GUTHRIE H.M. coroner for the Eastern District of the County of London died at his home at Wimbledon on April 13. He was born in December 1867, at Dundee and was educated at Edinburgh University, graduating M.B. Ch.B. in 1892 and proceeding to the M.A. and M.D. degrees in 1901 two years after being called to the Bar by the Middle Temple. From 1903 to 1914 he was deputy coroner for North East London. Then during 1915 he served in France as medical officer in the Royal Field Artillery, later taking command of the Fulham Military Hospital and after that becoming lieutenant-colonel in charge and commandant of the Belmont Prisoners of War Hospital. For his war services he was awarded the O.B.E. On returning to civil life Dr Guthrie was appointed coroner for the district in which he had been deputy. He had long been a member of the Coroners Society and was for some time treasurer of the London and Counties Medical Protection Society. In carrying out the work of his court he displayed a high sense of duty and was ever regardful of the feelings of others.

We regret to announce the death on April 10 after a short illness of Dr JOHN GALLETT of Bourne, Lincs. at the age of 75. He graduated at his native city of Edinburgh as M.A. Ed in 1881 and then, after a year at Marburg, returned to take his M.B. and Ch.B. degrees in 1886. He spent six months in Vienna before finally settling down in South Lincs. where he practised for forty-eight years. He took his D.P.H. Camb. in 1895 and was appointed M.O.H. for Bourne Rural District in 1907 after the Mivart report on the conditions there prevailing. Thanks largely to many years of patient effort on his part this area was transformed from the worst district to the best in the county. Housing, water supplies and an isolation hospital were all going forward before the war and the ground was thus ready for the intensive drive of post-war years. Dr Gallett was medical officer to the Bourne County Institution, to the Post Office, the Bourne Cottage Hospital, certifying factory surgeon and for a few years before he retired from public health work in district officer of health to the Bourne Urban District Council. He was made a J.P. in 1917 and during the war together with his colleague in the town staffed the local V.A.D. hospital. A scholar by nature and training Dr Gallett was one of the old school of family doctors devoted to work and finding in it his hobby. He gave his patients of his best with untiring zeal but was always impatient of humbug and conceit. Though of a retiring disposition his kindness, integrity and generosity made him a friend of all who came to seek his help. He had been a member of the British Medical Association for over forty years.

News has been received of the death on April 21 at Illovo, Johannesburg, of Dr FRANK BURNARD MUDD, younger son of the late Dr Barrington Mudd of Storrington, Sussex. Frank Mudd studied medicine at the Middlesex Hospital and after qualifying as M.R.C.S. L.R.C.P. in 1897 settled in the Transvaal where he became prominent as an anaesthetist, contributing papers on this

subject to the *Transvaal Medical Journal* in 1913 and to the South African Medical Congress of 1928. He joined the British Medical Association in 1912 and was for two years honorary treasurer of the Witwatersrand Branch. At the time of his death he was senior anaesthetist to the Johannesburg Hospital, lecturer on anaesthetics in the Witwatersrand University, and major in the Reserve of Officers of the South African Medical Corps.

Dr HERBERT VICTOR HORSFALL of Otley, Yorks. died on April 18, aged 42. He came of a Halifax family and studied medicine in Leeds, graduating M.B. and Ch.B. at the University in 1917. During the war he served as medical officer to a combatant unit in East Africa with the rank of captain, and on returning to civil life took up practice at Otley, where he recently succeeded his senior partner, Dr Galloway, as medical officer to the county council institution known as New Hall Infirmary. Dr Horsfall had been a member of the British Medical Association since 1918. He leaves a widow and two children.

Universities and Colleges

UNIVERSITY OF OXFORD

John Chassar Moir, M.D., F.R.C.S. Ed., reader in obstetrics and gynaecology in the University of London and assistant director of the Department of Obstetrics and Gynaecology at the British Post Graduate Medical School, has been appointed Nuffield Professor of Obstetrics and Gynaecology from October 1, 1937.

Schorssem Research Fellowship in Medical Science 1937

The Board of the Faculty of Medicine will make an election to the above Fellowship in June if a candidate of sufficient merit presents himself. The Fellowship of the value of £300 will be tenable for one year from October 1 in any medical department or institute at Oxford under such regulations as the Board may approve. Candidates must be graduate members of the University holding a registrable medical qualification and must be under 35 years of age on October 1. Candidates must submit their applications to the Dean of the Medical School, University Museum, not later than Monday, May 3. Each must submit evidence of age, testimonials (three copies) or names of referees, a statement of his career and a statement of the department of medical science in which he proposes to research.

UNIVERSITY OF CAMBRIDGE

Applications for the Marmaduke Shield Scholarship in Human Anatomy are to be sent to the Registrar on or before May 20 in the present term. The award will be made towards the end of June. Those eligible are such undergraduates of not more than three years standing from matriculation and such Bachelors of Arts of not more than four years standing from matriculation as have passed Part II of the Second M.B. Examination or done the equivalent of so passing and have also obtained honours in Part I of the Natural Sciences Tripos with anatomy as one of their subjects. Women also are eligible. The awarders will take into consideration not only candidates' performance in examinations in anatomy but also reports by the staff of the Department of Anatomy. The scholarship is normally tenable for a year from the date of the award but a scholar may be re-elected for a second year, whether he satisfies the rules of standing for a first election or not. The emolument of the scholarship is £100 a year.

The title of the degree of M.B. was conferred by diploma during March on Mrs. E. M. P. Wilson of Newnham College.

UNIVERSITY OF LONDON

LONDON HOSPITAL MEDICAL COLLEGE

A course of three lectures on "The Chemistry of the Carotenoids and Vitamin A" will be given in the chemistry lecture theatre of the Imperial College of Science and Technology, Imperial Institute Road, South Kensington, S.W. by Professor I. M. Heilbron, F.R.S., on May 24, 25 and 26 at 5.30 p.m. The lectures which will be illustrated with lantern slides are addressed to students of the University and to others interested in the subject. Admission is free, without ticket.

In a notice in our advertisement columns this week, the Senate of the University of London invites applications for the University Chair of Bacteriology, tenable at University College Hospital Medical School at a salary of £1000 per annum. Applications must be received by the Academic Registrar of the University Bloomsbury WC1 by May 14.

The first Open Entrance Scholarship for 1937-8 value £100 has been awarded to R. R. Hunter (Caius College Cambridge). Approx. Accessit J. F. Smith (St. John's College Cambridge).

UNIVERSITY OF GLASGOW

A graduation ceremony was held on April 24 when the following degrees among others were conferred:

MD—†Annie R. Chalmers, †D. K. McI. Chalmers, †E. Cochran (in absentia), †J. A. M. Hall, †D. W. Hendry, †W. Telfer, S. M. Laird, J. S. McNair (in absentia).

MB ChB—R. B. Wright, †J. C. Wilson, M. O. Alakija, I. A. McM. Beaton, W. Begg, S. A. Bond, J. M. Brown, R. Browning, B. Camber, Annie Cameron, D. A. Cannon, H. Carnovsky, J. Cassells, W. J. Christie, Isabel S. Craig, W. Cross, J. M. Cuthbert, A. L. Dick, A. Donald, Muriel F. Frew, C. R. George, W. E. Gifford, A. M. Gilchrist, D. R. Gorne, J. D. P. Graham, R. F. Hand, C. Hecht, Violet M. M. Howat, Mary McL. C. V. Howie, J. B. Hurl, A. Jack, M. I. Kerr, O. P. D. Law, on J. C. Liddle, B. D. Ling, J. Loudon, J. M. McBride, A. H. McDougall, J. C. MacIntosh, W. W. W. McNeish, A. M. Mullen, W. W. Millen, W. N. Miller, D. N. B. Morrison, K. Murray, W. G. Oman, J. R. Preston, P. A. Rodger, D. C. Russell, J. Shapiro, R. Smith, A. N. Surline, I. Stoll, Irma M. A. Thomson, J. D. Uytman, J. Y. Walker, Alexandra C. Walton, D. C. Wiseman.

† With commendation

ROYAL FACULTY OF PHYSICIANS AND SURGEONS OF GLASGOW

At a meeting of the Royal Faculty of Physicians and Surgeons of Glasgow held on April 5 with the president Professor Archibald Young in the chair the following were admitted Fellows of Faculty: Andrew Girdwood, Ferguson, M. B. Ch. B. Thomas Landles, Gordon, M. B. Ch. B. Donald Valsler Marshall, M. B. Ch. B. Arthur MacLennan Sutherland, M. B. Ch. B.

The Services

HONORARY SURGEON TO THE KING

Major General H. H. A. Emerson DSO has been appointed Honorary Surgeon to the King in place of Major-General FitzG. G. FitzGerald CB DSO who has been placed on retired pay.

INDIAN MEDICAL SERVICE

SPECIAL CORONATION DINNER

The annual dinner of the Indian Medical Service will be held at the Trocadero Restaurant, London, on Wednesday, June 16 at 7.15 p.m. when Brevet Colonel Sir Rickard Christophers CIE OBE FRS will preside. Officers can arrange to sit near their friends and separate tables to seat eight will be provided. Tickets may be obtained from the joint honorary secretary, Major Sir Thomas Carey Evans, Hammersmith Hospital, Duane Road, London W12.

DEATHS IN THE SERVICES

Surgeon Captain HUGH PRIDEAUX TURNBULL RN (retired) died at Southsea after an operation on April 11. He was educated at St. George's and after taking the MRCS and L.R.C.P. in 1897 entered the Navy. He became surgeon commander on May 25, 1911 and retired with an honorary step of rank as surgeon captain on January 1, 1924. He served throughout the war of 1914-18 receiving the medals. He had been a member of the British Medical Association since 1900.

Captain NISAR MUHAMMAD Durrani, Indian Medical Service, was killed in action in the recent fighting in South Waziristan on the North West Frontier of India near Jandoh on April 9, aged 31. He was born on January 1, 1906, was educated at the Punjab University and London Hospital and took the MRCS and L.R.C.P. in 1932. He received a temporary commission as lieutenant in the IMS on February 25, 1935.

Medico-Legal

RECOVERY OF FEES

A medical man is generally speaking, entitled to a reasonable fee and the question of what is reasonable has often been discussed by the courts in various circumstances. On March 17 two medical partners of Worthing claimed in the Worthing County Court £33 15s. 6d. from the father of a Cobham patient for professional services rendered between August 1933 and June 1936. The defendant had paid £15 into court together with three guineas costs with a denial of further liability. He said in his defence that the fees charged were exorbitant and unfair and that he had already paid more than enough. One of the partners said that the illness had been serious with unusual complications and that the defendant was well off, with a house at Hampstead and another by the sea at Ferring. In cross examination he agreed that if he had visited a similar class of house in Worthing he would only have charged half a guinea but said that he had had to travel for an extra half hour and therefore had charged a guinea a visit. The defendant said in evidence that no fee had been agreed but that he had expected from his previous experience to pay half a guinea a visit. The judge said that on the evidence a guinea a visit was not unreasonable, and gave judgment accordingly with costs.

LEAVE TO SUE A MENTAL HOSPITALS BOARD

By the Mental Treatment Act 1930 S. 16 anyone who wishes to bring an action against any person in respect of procedure carried out under the Act must satisfy the court that there are good reasons for alleging that that person acted in bad faith or without reasonable care.

A husband and wife recently applied to Mr Justice Talbot sitting in chambers for leave to bring an action against the Lancashire Mental Hospitals Board and two members of the medical staff of one of its institutions for negligence in allowing a certain mental patient out on licence. The patient had while on licence attempted to murder the wife by striking her on the head with a piece of wood. At the trial at assizes the medical superintendent said that the prisoner was a morally defective person of violent and dangerous propensities who ought not to be at liberty, that he himself was not responsible for granting the licence and that any two managers of the institution could write an order of release without the advice of the medical staff. Mr Justice Finlay ordered the prisoner to be detained at another institution.

Mr Justice Talbot came to the conclusion that there was substantial ground for alleging absence of reasonable care and in the exercise of his discretion gave leave to bring the action. The Lancashire Board and the two medical officers appealed and at the hearing before the Court of Appeal counsel for the board said that the occurrence had been a most lamentable one but those responsible for the patient had observed him themselves, had a report from the institution and been satisfied that his behaviour was excellent and that he was working. Counsel for the husband and wife contended that the Court of Appeal should not interfere with the discretion of Mr Justice Talbot as the board had not shown that he had exercised his discretion wrongly. Counsel also pointed out that the order for release on licence had been signed by the deputy medical superintendent and that the Act provided that no one but the medical superintendent had authority to sign it. Counsel for the board replied that even if the board's rules had not been approved by the Board of Control they were protected by Section 16 of the Act which provides that a person shall not be liable to proceedings on the ground of want of jurisdiction or any other ground unless he has acted in bad faith or negligently. He contended

that the licence was valid. Lord Justice Slesser the president of the court remarked that the court was only concerned with the question whether there was substantial ground for contending that the board acted without reasonable care in that the officer who ordered the patient to be released had no power to do so. The validity of the licence he did only arise in relation to the question of whether reasonable care had been taken. The court decided that Mr Justice Talbot was right in giving leave to bring an action. This decision of course does not in any way extend to the merits of the action if and when it is brought.

A PERFORATED EAR DRUM

A lady who suffered from irritation in her left ear was advised by her doctor to clean the inside of the ear every day with a pledget of cotton-wool on the blunt end of an orange stick dipped in almond oil. She did this for several years but one day left the cotton-wool inside the ear. As she could not get it out she consulted another medical man. According to her account, in attempting to remove the pledget with forceps he caused a severe rupture of the drum. This was treated by an aural surgeon but hearing was permanently impaired.

The patient sued the doctor for negligence and said in evidence that he had taken off his forehead mirror and tried to extract the cotton wool without it. The operation had caused great pain and she had shrieked and suddenly become deaf in that ear. He had used the forceps again producing the same pain and had then syringed the ear with warm water. She had become violently giddy and lost consciousness for a moment. The doctor on the other hand said that the piece of wool was stuck to the drum, he had put on a head lamp which gave perfect illumination, the patient had not shrieked but had complained of some pain, she had a particularly sensitive ear and the cotton wool was stuck, he had syringed out the wool and the patient had not fainted. He had found the drum perforated.

Mr Justice Greaves Lord in giving judgement, remarked that the patient had to prove that the injury was due to failure by the doctor to use competent and ordinary care and skill. It was he said extremely important that doctors who after education took upon themselves duties requiring great care, attention, and skill should perform those duties with reasonable competence. Equally it was extremely important—so important that the whole fabric of the law depended upon it—that no negligence should be inferred unless it was proved beyond reasonable doubt such as an ordinary man would act upon in his own business. This requirement made it extremely difficult for any plaintiff to prove his case. At first blush one might say that perforation of an ear drum is a mere attempt to take out a piece of cotton wool sounded like gross carelessness and nothing else. The answer however was not so easy as that because obviously something might quite possibly have taken place during the operation without gross negligence to account for the perforation. He had to be satisfied that nothing of that kind had taken place. The slight movement that would be necessary to cause the injury might be made without an honest witness recollecting it and it was extremely difficult to say that nothing of the kind had occurred. On the other hand the possibility of injury being suffered in the removal of a small piece of cotton wool without any neglect by the doctor was so great that he was not justified in concluding without positive evidence that a negligent act had been performed. He therefore dismissed the action with costs.

The judgement besides repeating in the clearest terms the ordinary principles of law governing actions for negligence against doctors is a useful reminder that an injury suffered in the course of treatment is not itself negligence and that an injured patient is not entitled to compensation merely because he has been injured.

MANCHESTER MEDICO-LEGAL SOCIETY

The Manchester and District Medico-Legal Society, which was founded towards the end of last year, held its inaugural dinner at the Manchester Reform Club on April 17 and an account of the proceedings has appeared in the columns of the *Manchester Guardian*. The president Judge T B Leigh was in the chair, and the speakers included the patron, Mr Justice Singleton, Dr Ainsworth Mitchell, president of the Medico-Legal Society of London, Sir William Willcox, president of the Medical Society of London and Dr G Roche Lynch, president of the Society of Public Analysts, and other analytical chemists. Judge Leigh, speaking of the antagonism and misunderstanding that had existed between the medical and legal professions, recalled the effort of the Manchester Medico-Ethical Society to improve matters by arranging discussions on such topics as "Where Law and Medicine Meet" and "The Doctor and the Law." Dr Ainsworth Mitchell, proposing a toast to the new society, spoke of the removal of barriers that arose because of technical differences and the use of jargon. There was still a lingering tradition that technical witnesses must use terms unintelligible to the lawyers. Mr Justice Singleton in his reply enlarged upon the same theme. Law had been defined, he said, as the absolute justice of the State enlightened by the perfect reason of the State. How could perfect reason be obtained in medical questions unless the parties understood each other's position? Co-operation in insanity cases offered great advantage and on the question of compensation for injuries much could be done by collaboration. If the medical profession could approach something like a standard of damages for the loss of a leg for the working man earning three to four pounds a week the legal profession would not have much hesitation in accepting it.

NATIONAL HOSPITAL, QUEEN SQUARE

FESTIVAL DINNER AT MANSION HOUSE

A brilliant company which included the Duke of Kent, Prince and Princess Chichibu of Japan, several of the Indian princes present in London for the Coronation and the French and Japanese Ambassadors assembled at the Mansion House on April 27 for the festival banquet of the National Hospital for Diseases of the Nervous System and the cause of the hospital was so effectively pleaded that £25,000 was raised at the tables towards the sum required for the completion of its new buildings in Queen Square. The Duke of Kent described the hospital as the oldest and largest in the world for nervous diseases. By the nature of the work which it had carried on so well for nearly eighty years it had created a special claim upon public sympathy. The speed at which life was now lived exacted its toll from the reserves of nervous energy and the results of strain and anxiety were found in many forms of illness and in almost every home. He especially commended the appeal to industry with every step towards science and mechanization a new source of nervous strain for the worker was created. The Rockefeller Foundation had with characteristic generosity offered £120,000 for the new research department of the hospital (it was explained later that £60,000 of this was towards the cost of the new building and £60,000 for endowment) conditional upon a similar sum being raised on this side.

The appeal was supported by Sir Walter Monckton, K.C. who said that the hospital treated 1,500 in-patients every year had 300 out-patient attendances almost every day and that during the last ten years more than 40,000 medical men and women from every university with a medical faculty had attended at Queen Square for study and research. New buildings were projected for a teaching school, pathological and research departments and a surgical unit the cost of which would be about £125,000.

and when these were completed the necessity would immediately arise for a new nurses home at a cost of £75 000. An overdraft of £30 000 on maintenance account had also to be extinguished so that the total liability was £240 000, about half of which sum was in sight.

The EARL OF ATHLONE congratulated the medical staff on what they had succeeded in doing in circumstances really detrimental to the effective treatment of patients suffering from nervous diseases. With the lack of up-to-date accommodation it had been necessary to take over some old houses, until portions of the hospital looked like a rabbit warren. Building operations had begun and steady progress was being made, but the great anxiety at the moment was to ensure the nurses home the completion of which should synchronize with that of the other buildings if the hospital was to do its work effectively.

LORD HORDER responding for the guests to the toast of their health said that throughout his professional career he had always regarded the National Hospital as the premier institution of neurology. It was sufficient to say that in its annals were the names of Hughlings Jackson, William Gowers, David Ferrier and Victor Horsley. The chairman of the hospital, Captain H. W. STYLES, in thanking the Lord Mayor (Sir George Broadbridge) for presiding and for the hospitality of the Mansion House mentioned that seventy-seven years ago when the hospital started it was due principally to the Lord Mayor of that time and the Mansion House might be said to be the birthplace of the hospital.

During the evening a film was projected showing scenes in some of the departments of the hospital with flash-backs to London streets and workplaces illustrating their hurry and tension as being the conditions which created the hospital's cases. It was stated that the exhibition of this film had already brought in £18 000 in small sums from picture theatre audiences.

Medical Notes in Parliament

On April 21 the House of Lords read a third time the Edinburgh Royal Maternity and Simpson Memorial Hospital Order Confirmation Bill and sent it to the House of Commons. The Hydrogen Cyanide (Fumigation) Bill passed through committee in the House of Lords on April 22, one minor amendment being made. On the same day a Bill to make provision for the removal of the Royal National Hospital for Rheumatic Diseases Bath to a new site in the City of Bath was passed.

The Report on the Investigation Conducted into Maternal Mortality at the instance of the Ministry of Health and a Report on Maternal Mortality in Wales were presented to both Houses of Parliament on April 22. On the same day Public Health (Imported Food) Regulations dated April 16 and made by the Minister of Health under the Public Health (Regulations as to Food) Act 1907 were presented to Parliament.

The House of Commons will adjourn for the Coronation and Whitsuntide from May 6 to May 24.

The House agreed on April 21 to amendments made by the House of Lords in the Education (Deaf Children) Bill. On April 27 the House debated the Budget Resolutions on report. The resolutions dealing with income tax were approved and Mr. Neville Chamberlain sketched out projected modifications of the National Defence Contribution. The Special Areas (Amendment) Bill was read a third time by the House of Commons on April 26.

Consideration of the Widows, Orphans and Old Age Contributory Pensions (Voluntary Contributors) Bill was concluded by the Standing Committee of the House of

Commons on April 27. The Bill as amended was ordered to be reported to the House.

The Report and Minutes of Evidence of the Select Committee on Medicine Stamp Duties and the Report of the Commissioners of Prisons and the Directors of Convict Prisons including the Report of the Medical Committee, were issued this week.

Sterilization in Hereditary Mental Deficiency

As briefly reported in these columns (April 17 p. 841) Wing Commander JAMES on the motion that the House of Commons should go into Committee of Supply on the Civil Estimates moved an amendment to the effect that the Government should give further consideration to the question of voluntary sterilization for hereditary defectives. He quoted the following paragraph from the report of the Committee on Scottish Health Services which he said put the whole matter in a nutshell:

"In considering what measures should be taken to improve the health of the people we have to take into account at the outset the question of heredity. Physical and mental capacity has a basis in inheritance and some people therefore because of their hereditary constitution will be less fit physically and mentally than others no matter what is done by way of medical care and improvement of environmental and other conditions.

It would be out of order for him that day to propose legislation to implement the recommendations in the report. All he could do was to invite the Minister to give his attention to the need for further research into the problem of genetics. The fact that his amendment was not completely in agreement with the recommendations of the Brock report was not because he disagreed with any of them or would in any respect depart from them but was merely a matter of technical form. Mental deficiency which covered the largest number of people concerned had generally in varying degrees a basis in heredity. There was a great deal of published evidence on this matter some of it reliable and much of it unreliable but a specific piece of accurate research was quoted in the report of the Departmental Committee. There were other forms of hereditary disability notably some forms of blindness.

A very comprehensive survey of this important subject was made and published in the report of the Brock Committee. Most of the opposition to the idea of sterilization came from people who had not read that report. The Brock Committee agreed with the findings of a previous committee which reported in 1929 that there were in England and Wales about 300 000 defectives and they gave as their opinion that of these 300 000 approximately 200 000 were fit for community life their degree of deficiency or defect not justifying their being retained in any form of institution. At present a very much smaller proportion than one third were in institutions or under care. In January 1936 the London County Council stated in a report that the London County Council Hospitals Committee was responsible for the care of 27 730 persons of both sexes but that since 1920 there had been an average annual increase of 603 and that during the next few years they anticipated a net annual average increase of 560 in the number of persons for whom accommodation would have to be provided. The expenditure on such cases by the London County Council during the last financial year was £1 698 633. There was an enormous total expenditure in connection with this problem. He did not suggest that if sterilization was legalized it would be an economy. In the long run there might be an economy but it was not from the point of view of economy that the Brock Committee recommended sterilization or that anyone else should consider the problem. All he suggested was that there was an enormous expenditure which if any part of it could be diverted to other channels and other social services would benefit the community as a whole. Any member who had not been over a mental hospital ought to do so. He would get a very vivid picture of the great misery which afflicted so many people. The hospitals were extraordinarily well and sympathetically run and the treatment given was splendid but one saw the number of unfortunate

people who were condemned largely through hereditary causes not only to lead miserable lives themselves but to be a source of great misery to their families.

BROCK COMMITTEE'S RECOMMENDATIONS

The Brock Committee recommended that subject to certain safeguards voluntary sterilization should be legalized where a person was mentally defective or had suffered from mental disorder where a person suffered from or was believed to be a carrier of grave physical disability which had been shown to be transmissible and where a person was believed to be likely to transmit mental disorder or defects. The Committee recommended that before sterilization was sanctioned in the case of a mental defective care should be taken to test his or her fitness for community life and that such a person should receive adequate supervision. The Central Association for Mental Welfare looked after persons who had been in institutions and had gone back to their homes or persons who needed assistance and help. That body had vast experience and it actively supported the suggestion that sterilization should be legalized. Its members pointed out that if the fear of parenthood could be removed it would greatly ease the mental condition of many defectives.

A point in opposition to this proposal was that the existence in the community of persons who had been sterilized would lead to a lowering of the standard of morality. That point was examined and answered by the Brock Committee. It had been examined and reported upon elsewhere and so far he had not heard any evidence adduced in support of it. There was still a great deal of misunderstanding about the nature of the sterilizing operation. Any doctor would confirm the statement that the operation was very simple and in the case of a male trivial. It had no effect whatever on the normal ordinary life of the individual. It had nothing in common with any of the operations used for the removal of any gland, it in no way affected sex life or sexual secretions. Another argument frequently used was that a mentally defective person could not have full volition. That argument again was dealt with extensively in the report. It should be remembered that sterilization for health reasons as opposed to eugenic sterilization was legal. Every year hundreds of people in this country had operations performed for reasons of their own health. Most frequently these operations were in women likely to be endangered by child bearing. They were voluntarily sterilized and that operation was legal. Thus the curious anomaly existed that whereas it was legal for a man or a woman to be sterilized even in a public general hospital if his or her own life was in danger it was illegal for such a person to be sterilized in the interests of posterity.

THE MENTAL DEFECTIVE'S VOLITION

Of the 300,000 defectives estimated to be in England and Wales 200,000 at least conducted their lives in the ordinary way as members of the community and for all other purposes save this were held to have volition. Their volition however was sometimes denied in the arguments which were put forward on this particular score. Mental disorder implied that a person was in possession of full mental capacity but suffered from a disturbance of the brain. Those who had recovered from mental disorder were held to have complete volition in other respects save this and research tended to show that theirs was the most hereditary type of mental trouble. Then there were people who had disabilities such as certain forms of blindness, which were hereditary. Was it to be said that they had not complete volition? There were also carriers persons who being themselves sound came from stocks so tainted that it could be said with varying degrees of assurance from moral certainty down to possibility that their progeny would suffer from some congenital trouble. In the last few years since the medical profession and a large section of the public learned how simple safe and effective the operation was many people were to-day upon eugenic grounds having themselves sterilized.

There was a general tendency for mental and physical defects to spread among the population. That was only to be expected when it was remembered that our social services had

had the effect among others of preserving the life of a great many of the weaker stocks which in earlier and less happy times would have been killed off by the ruthless pruning of Nature. The social services had expanded. All these alleviating and ameliorating factors operated without discrimination and to-day many children were born and grew up who in the lifetime of many members present and certainly in the lifetime of their parents would have been killed off by Nature's hard hand. There was one point by which the Brock Committee was very much impressed and by which anybody who had encountered it must be impressed. That was the position of the unfortunate normal child of a defective parent. It was perhaps one of the most telling arguments in favour of sterilization. Some proportion of mental deficiency was due to environmental causes usually prenatal infection. At present such persons who might be described as borderline cases might marry and have children.

He hoped that the Minister of Health would be able to give some statement on what was being done about the research recommended by the Brock Committee and incidentally by other bodies such as the Departmental Committee on Scottish Health Services of 1936. Those who advocated voluntary sterilization did not for a moment suggest that it was going to be a universal panacea or a substitute for other efforts. All they said was that for those who wanted it administered under adequate safeguards such as were recommended by the Brock Committee it would be a most important and very necessary weapon in the armoury of preventive medicine.

NOTHING COMPULSORY IN THE RECOMMENDATIONS

SIR FRANCIS ACLAND in seconding the amendment said that something ought to be done without too long delay. He emphasized a point implicit in the whole campaign for voluntary sterilization on the lines of the Brock Report—namely that it was the very reverse and antithesis of the whole idea of anything compulsory. The proposal was not that any one could go and get himself or herself sterilized but that there must be very careful inquiry and certification by two doctors who were both specially approved for the purpose with an expert Ministry of Health Committee in the background in case the Minister's advisers were not satisfied with the medical reports and certificates. That had this importance that in three out of four cases who would be entitled to apply for voluntary sterilization under the Brock Report the certificates could only be given if the practitioner was satisfied that the person applying was suffering or had suffered from disability or disorder deemed to be inheritable or was a person deemed to be likely to transmit defectiveness or disorder or great disability to a subsequent generation. No really honest opinion with regard to that could be formed—and it was intended that these opinions should be honest and careful opinions—unless practitioners concerned had had access to the family histories of both of the past generations and of the collaterals of the person concerned. No one would give information with regard to people of another generation if there was any possibility that as a result of such information a person might be sought out and compulsorily sterilized. Therefore the whole machinery on which voluntary sterilization rested which depended on the care and conscientiousness and thoroughness of these reports would be brought to naught immediately any system of compulsory sterilization was introduced.

The law as to sterilization of persons who were in their right mind at the time they applied for the operation was uncertain and a considerable majority of those might come under the Bill. Sterilization was believed to be legal if there were good eugenic reasons for it and if the proper consents had been obtained. But the doubt meant in practice that persons who had the means to consult a private physician and to employ a private surgeon could get the operation done but those whose means were limited so that they would be compelled to go to a hospital could not. They of course were just the people who because of the narrow compass of their homes and housing and sleeping accommodation, found lifelong and invariable self-control in the married state particularly difficult and almost impossible.

Mr LOGAN said it had been stated that people in possession of their faculties would not apply for sterilization. Therefore the amendment could not work because people in the possession of their faculties if they would not apply were the very people who would not be considered mentally defective. If they had not got their senses it could not be voluntary for they would not know what they were applying for.

Captain GUNSTON said that the Brock Committee reported that the children of parents one or both of whom are mentally defective are on the average below the normal and our inquiry shows that nearly one third of such children as survived are likely to be defective and more than two-fifths must be expected to exhibit some degree of abnormality. In the face of evidence like that it could not be said that we ought not to take measures to reduce the number of mental defectives born into the world. The Brock Committee came to the conclusion that though it might be difficult to trace antecedents valuable information might be obtained by finding out the proportion of mental defectives and subnormal children coming from mentally deficient parents. The result of the investigation was startling. Out of 8,800 cases investigated 2,000 children died at a very early age which indicated some direct connexion between infant mortality and mental deficiency on the part of the parents. The remainder were divided into age groups of those between 7 and 13 and those over 13 and it was found that no less than 40 per cent of the children still living were subnormal. When it was remembered that 22 per cent of the children had already died it would be seen that the proportion of subnormal children was high so high that the House could not regard the situation with complacency. When it was realized what normal or abnormal children born of abnormal parents must go through surely it was not asking very much to advocate that sterilization should be permissible.

GOVERNMENT REPLY

Sir KINGSLEY WOOD said that an allegation had been made that there had been an increase in the number of defectives in this country. Of course it should be borne in mind that the number of defectives under care increased as the general population increased and as the local authorities became more efficient in ascertaining the existence of defectives but it could be said with authority that there was no proof that the incidence of mental deficiency in this country was rising. Members would appreciate the importance apart from the merits of the case of taking public opinion wholly with them. Sterilization laws were in operation in several of the United States but in some little use had been made of them. In certain cases the law appeared to have been enacted without any money being provided but the real explanation of failure in other cases was probably that the enthusiasm of small groups secured the passage of legislation for which there was no general demand and no sufficient backing of public opinion.

One or two Members had made observations which would lead one to think that in certain cases the treatment of people who unhappily suffered from mental deficiency was—one expression used—very horrible. He must testify however to the increasing provision care, forethought and kindness displayed in these institutions. He would not like it to go out that there was anything else but the utmost consideration shown and large sums of money spent to see that reasonable care and treatment were given. A great deal of research was being done in this country. For instance only in 1934 in consultation with the Board of Control the Medical Research Council appointed a new committee to advise and assist them in promoting research into mental disorders. Another committee of equal importance had also been appointed by the Medical Research Council a committee on human genetics. In spite of the advances made in the biological study of heredity and the application of the results, it was felt that the study of human genetics had been relatively neglected. Under the aegis of this latter committee some very interesting researches were now being carried out at the Royal Eastern Counties Institution at Colchester by Dr Penrose and his colleagues and an important examination of the hereditary characteristics in the blood of mental defectives and their

families was now being made by Professor Fisher and Dr Taylor of the Galton Laboratory University College London. This work was being assisted by grants from the Rockefeller Foundation. Dr Slater at the Maudsley Hospital London was also working on a large-scale field of inquiry into certain different types of mental disorder. Other work was also being carried on so that it would be seen that this aspect of the question was not being neglected by the Government.

Wing Commander JAMES asked if the Minister could give an assurance that any funds needed for research would also be forthcoming from the Government?

Sir KINGSLEY WOOD said that would be a very bold undertaking to give without consultation with the Chancellor of the Exchequer but if a question of money arose which he (the Minister) thought was important he would not hesitate to take it to the Chancellor of the Exchequer. There was no doubt that opinion was growing in favour of sterilization. But he could not disguise the fact that opposition still remained and there was much conflict of opinion particularly on religious grounds. The medical profession was by no means unanimous on the matter. If one asked even the medical men that one knew in one's private circle there was not a great deal of unanimity of opinion. Resolutions of certain learned colleges had been quoted but he very much questioned whether one would get anything like unanimity from the British Medical Association.

Mr THURTELL asked if it was not a fact that on most matters one could not get unanimity in the medical profession. The Minister replied there were always small minorities and one dealt with them as best one could but there would be found he thought in the British Medical Association a pretty steady and strong view on most medical matters of the day. He was endeavouring to put fairly the other side of the question and he doubted very much whether they would get a strong vote as would justify a Bill being promoted at this moment. It was desirable that ample time should be given for consideration and to get public opinion developed as he believed it was developing.

Wing Commander JAMES then withdrew his amendment.

Expenditure on School Medical Inspection and Treatment

Mr OLIVER STANLEY replying to Mr Riley on April 12 said it was not possible to separate the expenditure of local education authorities on the medical treatment of school children from their expenditure on medical inspection. The net expenditure on the medical inspection and treatment of public elementary school children during the year ended March 31 1936 was £2,188,462 of which 50 per cent was met by grants from the Board of Education. The net expenditure of local education authorities on the education and treatment of children in special schools during the year ended March 31 1936 was £2,110,693 of which 50 per cent was met by grants from the Board of Education which also paid grants amounting to £38,034 directly to certain special schools provided by voluntary bodies. The figures, however, included expenditure on schools for blind, deaf, and mentally defective children where the expenditure on medical treatment was comparatively small. Expenditure on sanatorium schools for children suffering from tuberculosis was not included as such expenditure was incurred by the tuberculosis authority and not by the local education authority and grant in respect of it was not paid by the Board of Education. During the year ended March 31 1936 the average attendance of children sent to special schools by local education authorities was 38,939. In schools for physically defective children as distinguished from schools for blind, deaf, mentally defective or epileptic children the average attendance of children sent by local education authorities was 19,769.

Sale of Methylated Spirits in Scotland

The Methylated Spirits (Scotland) Bill the object of which is to control the sale in Scotland of methylated spirits and of methylated spirits in admixture was considered by a Standing Committee of the House of Commons on April 13. Mr HARDIE moved an amendment to prohibit the retail sale of

methyated spirits unless under all the conditions laid down by Act of Parliament for the sale of poisons as scheduled in the No 1 List of Poisons. Bulk quantities would have to be signed for in the same way. He said that the proposal in the Bill that the retail sellers should be registered with the local authority and that purchasers should sign a book would not have the desired effect of stopping the evil. There would not be the same difficulty with other 'dope' taken by people with plenty of money, because ships arriving from abroad were inspected at the ports for 'dope'. Miss HORSBROUGH who was in charge of the Bill, asked Mr Hardie not to press the amendment. The Bill was only the starting-point and it was impossible to go as far at present as the amendment would take them. The amendment was withdrawn.

Mr WESTWOOD moved an amendment to ensure that the restrictions in the Bill should apply to surgical spirit as well as to methyated spirits. Lieut-Colonel MOORE said that owing to the smell of methyated spirits surgical spirit was ousting it as a drunk and a new bath essence was proving almost as seductive. Mr JOHNSTON said that addicts, by shaking a little milk on top of eau de Cologne could obtain a drinkable spirit more readily and cheaply than by purchasing methyated spirits. The amendment was agreed to.

Combating Overcrowding in Scotland

On April 13 Mr MAXTON asked the Secretary of State for Scotland if he could state what progress had been made since the passing of the Housing Act 1935 in combating the problem of overcrowding in Scotland and in how many places had the appointed day been fixed. Mr ELLIOT said that since the passing of the Act tenders had been approved for 36,012 houses and 24,377 houses had been completed. These houses were not specifically approved for subsidy purposes under either the Acts of 1930 or 1935 but under arrangements designed to secure that the most economical use was made of the new accommodation they were used for slum clearance or overcrowding purposes as local circumstances or needs might dictate. There was no record of the number of families actually removed from overcrowded houses before April 1 1936 but from that date to February 28 1937 6,444 families living in overcrowded conditions were rehoused. The appointed day under the Housing (Scotland) Act 1935 had so far been fixed only for the Dysart Ward of the Burgh of Kirkcaldy. The date fixed in this instance was May 15 next.

Control of Hydrogen Cyanide

Lord DUFFERIN in the House of Lords on April 14 moved the second reading of the Hydrogen Cyanide (Fumigation) Bill. He said it had received a second reading in the House of Lords less than a year ago and its purpose was to regulate the use of hydrogen cyanide. This was most efficacious for exterminating bugs and other vermin and the pests that preyed on the vegetable world but it was extremely dangerous. A very small quantity was fatal and the victim was usually dead before he had any warning. Fatalities had occurred and the Government was convinced that statutory powers were necessary to protect the public. The Bill conferred power to make regulations to control dangerous methods of generating the gas to control or prevent inexpert operation of it to control the disposal of residues and to regulate the use of premises during and after fumigation by the gas. Fumigation of rabbit warrens and fumigation carried out in the open air where there was little danger, were specifically exempted from the Bill. Every interest would be consulted by the Home Office before the regulations were decided upon and the proposed regulations would be open to inspection for forty days. The Bill had its counterpart in almost every country in Europe and if passed would save many lives.

The Bill was read a second time without a division and sent to a committee of the whole House.

Scottish Maternity Services Bill

The Maternity Services (Scotland) Bill as amended in Standing Committee was considered on report by the House of

Commons on April 15. Mr LEONARD moved a new clause (Panel of Registered Medical Practitioners) as follows:

It shall be lawful for a local authority in consultation with the local organization of registered medical practitioners as referred to in Subsection (5) of Section 1 of this Act to publish annually a panel of registered medical practitioners for the purposes of Section 22 to the Midwives (Scotland) Act 1915 such panel to consist of registered medical practitioners regularly practising midwifery and to be made available to all certified midwives practising within the area of the local authority.

Mr WALTER ELLIOT said he had every sympathy with the object of the clause. The schemes under the Bill would make provision for the midwives to know where were the practitioners and the specialists. The schemes would cover 80 per cent of the confinements in Scotland and the other 20 per cent would be those of the well-to-do who had their own doctors and were in touch with obstetric specialists. It would not be left to the midwives to pick a doctor from a casual list of practitioners. It would be the duty of the midwife to work with the woman's own medical attendant and if she did not know where the medical attendant was or where in his absence some other practitioner could be found, then she would be at fault under the new schemes. Mr LEONARD withdrew the proposed new clause.

On Clause 1 (Provision of Maternity Services) Mr ELLIOT moved to insert an amendment to provide that medical schools and midwifery training bodies should have an opportunity to make representations on the schemes proposed. The amendment and further minor ones were agreed to. Small amendments resulting from the delay in the passing of the Bill were made in Clause 4 (Compensation to Midwives Ceasing or Required to Cease Practise).

On Clause 6 (Prohibition of Unqualified Acting as Maternity Nurses for Gain) Mr WESTWOOD moved to provide that persons attending confinements under the Act should have undergone at least three years training. He said it was unsatisfactory for it to be possible, as under the clause at present, for a young medical student just entering his studies or for a nurse just starting on her training to be able to take control of a case.

Mr ELLIOT said that neither medical students nor pupil midwives could now undertake a domiciliary case until they had had a complete theoretical course and adequate practical instruction including the delivery of women in labour under qualified supervision in an institution. The existing safeguards went further than the proposed amendment. Under the rules of the General Medical Council no medical student might undertake practical midwifery until the last term of the fourth year of his curriculum. He undertook when scrutinizing schemes prepared by local authorities under the Bill to ensure that no danger arose of medical students going out to cases earlier than that period. He was certain the General Medical Council had no intention of relaxing the rules, but he did not wish to put the matter into the statute or to make it too rigid.

Mr WESTWOOD withdrew his amendment, and moved a subsequent one to provide that a nurse attending a case should have undergone at least two years training with a view to becoming a midwife. Mr ELLIOT said this amendment dealt with a subordinate who would not regard herself as being in charge of a case. A midwife could rightly put responsibility on the medical practitioner and if she found herself in difficulty was expected to call in a doctor. The full course of the midwives curriculum under the rules of the Central Midwives Board extended over only twelve months and the amendment would not be possible in practice. That Board contemplated an extended period of training, but not to the extent which would make the amendment practicable. It would be difficult for the House to amend by statute the rules of the Central Midwives Board but he would see that untrained persons did not get the opportunity of experimenting on those for whom the House was passing this measure.

The amendment was withdrawn and on the motion of Mr ELLIOT three small amendments were made in later sections of the Bill without discussion. The Bill was read a third time.

Mortuary Provision

Mr CECIL WILSON asked on April 22 how many local authorities other than those of county boroughs had provided mortuaries as empowered by Section 143 of the Public Health Act of 1875 and how many had not made any such provision. Sir KINGSLEY WOOD said he had no complete information but since April 1 1920 loans had been sanctioned by the Ministry of Health for the provision of mortuaries by sixty three local authorities other than county boroughs.

Answering Mr Wilson on the same day Sir JOHN SIMON said that excluding the City of London the County of London and county boroughs forming complete coroners districts 10 274 post mortem examinations were directed or requested by coroners. He had no information on how many of these examinations took place in hospitals in mortuary premises and in other places. He did not know that on a recent occasion there was no fit place for a post mortem examination and that it was held on the village green.

Capitation Fee Tribunal

In the House of Commons on April 26 Mr RHYD DAVIES asked the Minister of Health the terms of reference and the *personnel of the tribunal to inquire into the fees paid to panel doctors under the national health insurance scheme*. Mr HUDSON replied that the arrangements for the inquiry were not quite complete.

Poole Corporation Bill and Pasteurization

In the House of Lords on April 27 Lord MARKS moved the second reading of the Poole Corporation Bill, which was agreed to. Lord CRANWORTH then moved an instruction to the committee which will consider the Bill to delete Clause 21 which relates to by laws as to pasteurization etc. of milk. He said that the Poole Corporation admitted that this clause was included in the Bill because of the recent outbreak of typhoid at Bournemouth. This was panic legislation. Viscount HALIFAX said that the health of the people must be the first and last consideration and the question of vested interests did not arise. The Bill was not opposed on petitions but he understood it was the intention of the Chairman of Standing Committees to refer the Bill to a Select Committee of the House in order that the proposals as to pasteurization might be examined. In the Government's view such an inquiry would be unsatisfactory and probably inconclusive. It ought not to be held in connexion with any particular locality; the question must and could only be considered as a general one affecting the country as a whole. In the circumstances the Government had reviewed the whole matter and he was authorized to announce that it was its intention to bring forward long term legislation dealing with milk policy generally in the near future. In this connexion the Government would examine the question of pasteurization in the light of all the evidence that was available. He supported Lord Cranworth's motion.

Lord DAWSON of PENN said that the Poole experiment would have been a very valuable one but they were obliged to be influenced by the question of cost. If it was to be such a costly matter he could see the force of the argument for waiting for a general measure. But no indication had been given how long it would be before that general measure came into operation. There was an overwhelming body of evidence in every civilized country that pasteurization was an efficient means of preventing the continuance of certain infectious diseases. The mortality from tuberculosis had declined but there had not been so much improvement in regard to the bovine type of infection as in regard to the human form of infection.

Lord Cranworth's motion was agreed to.

Sickness and the Drug Fund—Colonel ROPNER on April 13 asked the Minister of Health whether in view of the incidence of sickness during the early months of the present year he proposed to make special provisions to ensure that the Drug Fund should be able at the end of the year to meet in full

its liabilities to chemists and bodies corporate dispensing under the National Health Insurance Acts. Mr HUDSON answered that as the Drug Fund related to the calendar year it would be premature at this stage to estimate the extent if any to which payment of the chemists' accounts would be affected by the sickness experience early in the year. The Minister of Health undertook at the time at which the present agreement with the chemists was made to consider representations regarding any abnormal deficit in the Fund.

Drunkenness Alleged from British Wines—Mr LEES JONES on April 19, asked the Home Secretary if his attention had been drawn to the result of the investigation which the Manchester licensing magistrates had made on the subject of drunkenness caused through British wines and whether he would take steps to mitigate this cause of drunkenness. Mr GEOFFREY LLOYD replied that the Home Secretary had received from the Manchester licensing justices a copy of a speech by their chairman in which reference was made to certain cases of drunkenness treated at the Manchester Royal Infirmary last Christmas. The Home Secretary understood that these cases were not attributed to the drinking of British wine but he was making further inquiry.

Electro filters and Poisonous Smokes—On April 19 Mr LLOYD informed Mr Parker that the possibility of employing electro-filters as a protection against poisonous smokes had been considered. This method involved practical complications and satisfactory protection could be provided by simpler and cheaper methods.

Grants to Scottish Universities Inquiry Committee—Answering Mr Alexander Morrison on April 20 Mr PARKER said he had decided to appoint a committee in terms of Section 16 (1) (b) of the Education (Scotland) Act 1908 to inquire into the application made by the University Courts of the Universities of Scotland for the payment from the Education (Scotland) Fund of sums in respect of yearly maintenance expenditure and to advise him as to the sums if any which should be paid to them. The chairman of the committee would be Lord Alness and Sir Arthur Rose and Sir George Macdonald would be the other members.

Infant Mortality—Sir KINGSLEY WOOD answering Mr Will Thorne on April 22 said that for 1935 the last year for which separate figures were available the mortality rates of infants under 1 year over 1 000 live births were: Letchworth U.D. 17, England 56, Wales (including Monmouth) 63. Letchworth was a small unit the total births there being 200 or less each year. During the past five years the infantile mortality rate there had been 17.62 per 1 000 births.

Birching at Doncaster Court—Sir JOHN SIMON told Mr Alfred Short on April 22 and on April 7 the justices in the West Riding Juvenile Court Doncaster ordered nine boys to receive three strokes of the birch. Eight were birched on that day; a medical officer certified that a ninth was unfit for the punishment. As he had decided to appoint a Committee to consider the question further action on his part was not required.

Blood Transfusion in the Army—On April 27 Mr W. KEFIELD asked the Secretary of State for War what supplies if any were available of human blood suitable for transfusion, grouped and bacteriologically tested for large scale emergency treatment. Mr DUFF COOPER replied that the Army policy was not to store blood for large scale transfusion as the period for which this could be done was very limited. Each military formation had a number of donors grouped and tested who were available for this service.

Provision of Canteens in Schools—Mr OLIVER STANLEY stated on April 22 that he had drawn the attention of local authorities to the desirability of providing school canteens at schools where children came from a distance. In considering plans for new senior schools this point was always borne in mind. He would also consider any proposals by local authorities to make arrangements for school dinners in schools where children did not come from a distance but was not prepared to require the provision of canteens in all new senior and junior schools.

Maternal Mortality Report

The report on maternal mortality in England was issued by the Ministry of Health on April 28 (Cmd 5422 H.M. Stationery Office 5s 6d.) It finds that the factors in the problem cannot be separately assessed. There is no necessary relation between maternal mortality and housing conditions. The report advises local authorities to secure team work between health visitors, midwives and doctors and Sir Kingsley Wood is making suggestions for this purpose and observations are made on the ill effect of haste and too early use of instruments in confinements. The report says that every doctor who does midwifery cases under local authorities schemes should be experienced and actively engaged in such work have enough time for unhurried work and be ready to co-operate with the local authorities' own officers. Every local scheme should provide specialist consultants and Sir Kingsley Wood is urging local authorities to arrange for flying squads of skilled hospital staffs to be brought to the patient where she cannot be moved to hospital without risk to life. The report finds that attempted abortion is probably increasing, and Mr Norman Birkett, K.C. will act as chairman of a Departmental Committee to be set up at once to inquire what can be done to reduce mortality from this cause. The report suggests further research into the influence of diet on child bearing, and the Minister is in touch with the Medical Research Council on the subject. A similar report is made in regard to Wales.

Medical News

As the House of the British Medical Association (including the Library) will be closed on Coronation Day (Wednesday May 12) all editorial communications and advertisements intended for the issue of the *British Medical Journal* of May 15 should reach the Editor and the Financial Secretary and Business Manager respectively by Monday May 10 at the latest. The House of the Association will also be closed for the Whitsun holiday from 6 p.m. on Friday May 14 to 9 a.m. on Tuesday, May 18 (Library 10 a.m.)

To celebrate the Coronation a reception will be given at the Royal Society of Medicine on Monday, May 10, at 8.30 p.m. when films will be shown and interesting exhibits provided. The object of the reception is primarily to entertain medical men and their wives from over seas who are in London for the Coronation. As accommodation is limited and as first call for tickets is with the guests of the Society there will be only a few tickets available for Fellows and their wives. Those Fellows desirous of attending should communicate with the secretary not later than May 3, when a ballot for the remaining tickets will be held. Applications are limited to two tickets.

The London Jewish Hospital Medical Society has arranged a symposium on "Modern Aspects on the Diagnosis and Treatment of Gastric Ulcer" which will take place at the Hospital Stepney Green E., on Thursday May 6 and will be opened by Dr D. T. Davies Professor G. Grey Turner and Dr H. Graham Hodgson. The president Mr Arnold Sorsby will take the chair, and tea will be served at 3.15 p.m.

A general discussion on "Reform of Medical Education" promoted by the Edinburgh University Debates Committee consisting of representatives of the Students Representative Council, the University Union and the University Women's Union will be held in the University Union Edinburgh on Thursday May 6 at 8 p.m. The opening speakers are Sir Francis Fremantle M.D., M.P., Chairman of the Parliamentary Group House of Commons, Dr G. O. Barber Dunmore, Essex and Professor Sydney Smith M.D., Dean of the Faculty, Edinburgh.

University Miss Agnes MacLaren, president of the Women's Union will take the chair and the summing up of the discussion will be in the hands of Dr Chalmers Watson, Edinburgh.

The University College (late Queen's College) Galway North of England, and Midlands Alumni Association will hold its eleventh annual medical reunion at the Midland Hotel Peter Street, Manchester, on Saturday May 8, at 7.30 p.m. followed by dinner at 8 p.m. The subscription is one guinea, which includes the dinner, cost of organization printing etc., and all Galway graduates are invited. The president of University College Galway, Monsignor Hynes D.D. will be guest of honour. Those who intend to be present are asked to notify the honorary secretary, Dr P. J. Webb 127 Rochdale Road, Harpurhey, Manchester, 9.

Professor Charles Singer will read a paper entitled "Medicine in Early England" before the Listerian Society of King's College Hospital in the lecture theatre of the hospital Denmark Hill, S.E., on Wednesday, May 5, at 5.15 p.m.

The annual meeting and luncheon of the Tavistock Clinic will be held at the Wharcliffe Rooms Hotel Great Central Marylebone Road, N.W., on Monday, May 3 at 12.15 p.m., when Sir Henry Brackenbury will preside.

A sessional meeting of the Royal Sanitary Institute will be held in conjunction with the Welsh Branch of the Society of Medical Officers of Health and the South Wales and Monmouthshire Branch of the Sanitary Inspectors' Association in the Rolls Pall Monmouth on Friday, May 7, at 5 p.m. when there will be discussions on Immunization in Diphtheria, to be opened by Dr W. R. Nash and Dr W. Panes and on 'The Public Health Acts, and their Implications in Rural Areas'.

The Priory Church and the Hospital of St Bartholomew in West Smithfield, London, E.C., both founded in A.D. 1123 will be open to view during the Coronation period, especially to visitors from over-seas. Conducted parties will be met at the church first at 11 a.m. and 2 p.m. each day from Thursday, May 7 to Friday May 14 excluding Sunday and Wednesday. In connexion with this viewing there is to be an exhibition in the Great Hall of the hospital, in which unique documents, seals and books will be shown, and stands will bear drugs from all parts of the British Empire and substances made from coal and used in medicine. Talks will also be given on the world-famous Hogarth paintings on the walls of the great staircase.

A Clinical Society of the Royal Eye Hospital has been organized, and a meeting will be held on Tuesday May 4 at 6 p.m. at the hospital when Dr T. Rowland Hill will read a paper on "Neuromyelitis Optica," illustrated by cases. All medical practitioners will be welcome. Further particulars may be obtained from the honorary secretary, Mr J. Minton F.R.C.S., Royal Eye Hospital, Southwark.

A meeting of the Paddington Medical Society will be held at Paddington Town Hall, Paddington Green, W. on Tuesday May 4 at 9 p.m., when there will be an address by Dr G. F. McCleary on "The Threatened Depopulation of the British Commonwealth." All interested are invited to attend.

An exhibition of hygiene will be held in Vienna from the middle of May to the end of June under the patronage of the President of the Austrian Government.

At the annual meeting in Droitwich of the British Spas Federation Alderman C. H. Hacker of Bath was elected chairman in succession to Alderman Kidson of Harrogate and Mr John Hutton spa director of Bath, was re-elected honorary secretary.

Under the title of "Hospital Medical Library Suggestions" the issue of the *Journal of the American Medical Association* for March 27 which is a hospital number, contains a selection of leading British and American journals and textbooks suitable for a hospital library.

Letters, Notes, and Answers

All communications in regard to editorial business should be addressed to THE EDITOR, BRITISH MEDICAL JOURNAL, B.M.A. HOUSE, TAVISTOCK SQUARE, W.C.1.

ORIGINAL ARTICLES AND LETTERS forwarded for publication are understood to be offered to the *British Medical Journal* alone, unless the contrary be stated. Correspondents who wish notice to be taken of their communications should authenticate them with their names, not necessarily for publication.

Authors desiring REPRINTS of their articles published in the *British Medical Journal* must communicate with the Financial Secretary and Business Manager, British Medical Association House, Tavistock Square, W.C.1, on receipt of proofs. Authors over seas should indicate on MSS. if reprints are required as proofs are not sent abroad.

All communications with reference to ADVERTISEMENTS as well as orders for copies of the *Journal* should be addressed to the Financial Secretary and Business Manager.

The TELEPHONE NUMBER of the British Medical Association and the *British Medical Journal* is EUSTON 2111.

The TELEGRAPHIC ADDRESSES are

EDITOR OF THE BRITISH MEDICAL JOURNAL *Atiology*
Westcent London

FINANCIAL SECRETARY AND BUSINESS MANAGER
(Advertisements etc.) *Articulate Westcent London*

MEDICAL SECRETARY *Medisera Westcent London*

The address of the B.M.A. Scottish Office is 7, Drumsheugh Gardens, Edinburgh. The address of the Office of the Irish Free State and B.M.A. is 18, Kildare Street, Dublin. Telephone 62550 Dublin.

QUERIES AND ANSWERS

Achondroplasia

W. R. (Belfast) writes: I have under my care at the moment a boy of 1½ years suffering from the above. He is an only child and his parents are greatly disappointed that his condition should be considered incurable. I would be grateful for any suggestions regarding causation and treatment.

Asthma Query

"P.L.E.A." writes from South Africa: My son aged 4 years has been suffering from bronchial asthma since he was 2½ years old. The condition followed the removal of congenital adenoids. The attacks are experienced every four to six weeks and usually follow an acute coryza. So far I have been unable to identify the offending allergen which must be present daily to produce the constant rhinitis, and which is so intensified by the advent of a cold as to cause an attack of asthma. Frequent investigations of the nose for sinusitis and of the diets have not helped. I would be glad if some reader could suggest a diet free from milk and cereals which will be tasty and appetizing. Would an autogenous vaccine or a stock anti-catarrhal vaccine be of use in preventing attacks?

Iodine in Pulmonary Tuberculosis

Dr. H. A. MURRAY (Exeter) in reply to Dr. W. O. C. Hunt (*Journal* April 24 p. 900) writes: I remember that Dr. Guy, one time assistant M.O.H. for Edinburgh, was trying this method of treatment about 1923 and I believe he intended to incorporate the results in a book. Again in 1926 in my thesis for M.D. Edinburgh I suggested that iodine would prove to be the most valuable drug in the treatment of pulmonary tuberculosis.

Income Tax

Co-operative Stores Dividend

"Y." inquires whether he should include in his return dividends received as a member of the local retail co-operative store.

"*." Interest received from deposits with a co-operative society is liable to assessment, and so are dividends received on shares in such societies, but the so-called "dividends" paid in respect of purchases are not liable to tax and should not be shown on the form of return.

Nursing Home Fees Car Replacement

"J. A." inquires (a) whether nursing home fees paid for oneself are allowable, and (b) what allowance he should have if he replaces a 14 h.p. car bought in 1930 for £285 for another of similar h.p. which will cost £265 less, say £10 allowable for the old car. Depreciation has not been claimed.

"*." (a) The fees are not allowable, they are personal rather than professional expenses. (b) If cost of replacement is claimed the amount allowable as an expense of 1937 will be £265 - (say) £10 = £255—that is the actual out of pocket expenditure in the circumstances it is preferable to claim the obsolescence allowance, which is £285 - (say) £10 = £275 or £265 whichever is greater.

LETTERS, NOTES, ETC

Kitchen Offices in Hospitals

A Chadwick Trust Lecture on the plan and equipment of kitchen offices in hospitals and other institutions was given by Miss R. Whitaker, principal of the Gloucestershire Training College of Domestic Science at the Royal Sanitary Institute on April 15. The lecturer referred to the astonishing effects on output which followed the application of scientific studies to the layout of factories and training workers. Application of the same principles to the women's workshop had been unduly delayed, but it was now attracting much attention in the effort to lessen drudgery and make domestic work more attractive. While the principles were the same whether for the kitchen of the council house or for the great hospital or school, the result in the elimination of unnecessary labour, improvement in standard of output and of health and contentment of workers was naturally immensely greater in the institution. The first essential was rational planning, based upon certain simple principles which however usually required the aid of the expert in their application, since probably no two sets of conditions were identical and the alteration of the position of a single item of apparatus might destroy the efficiency of the whole plan. The essentials were that raw materials should enter the building as near as possible to the place where they would be stored until they were used. Each item which was to form part of the meal or meals undergoing preparation should travel steadily forwards through the various processes of preparation with no backward movements and as little cross-tracking of workers as possible, until the finished product was assembled in the hot or cold closets of the service. Miss Whitaker showed slides illustrative of the application of these principles in industry and of their contravention in the kitchens of even modern institutions where the plotting of the workers' movements produced wild confusions of line such as might have been made by a mouse in a cage. The lecture will be printed in full in the June number of *Nosokomeion*, the official organ of the International Hospital Association, published at Buchschlag, Hessen, Germany.

Another Warning

Dr. G. L. DAVIES (London SW6) writes: I should be glad to know if any of your readers have been called upon by a slight delicate-looking young man (usually wearing a bowler hat and a blue overcoat) who sells potentiometers to enable ophthalmoscopes, etc. to be illuminated from the house circuit. I have seen him once in the North and twice down here, and on the last occasion he prevailed upon me to pay him 10s. (plus 3s. 6d. for certain accessories) for one of his potentiometers, which he normally sold (so he said) for £2 15s. He told me a story about having run out of money, and having nothing to pay his fare home. He left no address and the accessories have never arrived. One of the local doctors who is also supposed to have bought one of these articles has just told me that he didn't. An electrician who dismantled the apparatus said the components were of the cheapest and the handsome piece of chrome steel which formed the panel for the switch etc. is nothing but a piece of brass chromium plated. I was warned that there was a great risk in using the instrument as the flex is much too thin to stand the average voltage in a house.

Corrigenda

Dame LOUISE MCILROY writes: I would be glad if you would kindly correct a mistake I made in the manuscript of my paper on surgical intervention in obstetrical practice (*Journal* April 17 p. 800). At the paragraph referring to the third stage of labour, "Injection of saline solution into the umbilicus in some cases effects delivery of the placenta" should read "Injection of saline solution into the umbilical cord in some cases effects delivery of the placenta."

We regret that by a slip of the pen the name of Miss Susan Musson, general secretary of the National Council for the Unmarried Mother and her Child, was incorrectly given in a paragraph about her pamphlet *The Unmarried Mother* published last week at page 876.

EPITOME OF CURRENT MEDICAL LITERATURE

Medicine

338

Essential Hypertension

L. HANTSCHMANN (*Klin Wschr* March 13, 1937, p 378) is of the opinion that a certain proportion of cases of essential hypertension is due to endocrine dysfunction. He points out that hypertension and disturbances of carbohydrate metabolism occur characteristically in Cushing's syndrome, in which hyperfunction of the pituitary appears to be the commonest aetiological factor. The presence of hypertension in Cushing's syndrome on the one hand and the diabetic tendency in cases of hypertension on the other led the author to investigate the blood pressure in 452 diabetics. He found that hypertension was more common in diabetics than in normal persons of the same age, and that it was more often present in the mild hypophyseal diabetes of old age than in the grave pancreatic diabetes of the young. Examination of the blood sugar in patients with essential hypertension showed that in more than 50 per cent the blood sugar values were raised and that carbohydrate tolerance was lowered. Hantschmann shows that the problem of the hormones producing vasoconstriction is not yet solved. He points out that the posterior pituitary hormone only raises the blood pressure slightly, and that the presence of adrenaline in the blood of patients with essential hypertension has never been proved. He was able to produce hypertrophy of the adrenals in five guinea pigs into which he injected posterior pituitary hormone daily for a year. Hypertrophy was most noticeable in the zona fasciculata of the cortex. He suggests that essential hypertension may be due to a corticotrophic hormone engendered by an abnormal interrelation between the pituitary and the adrenals.

339

Gastric Haemorrhage

H. J. USTVEDT (*Tidsskr norske Lægeforen* March 15, 1937, p 289) reviews the experience of the Ullevaal Hospital in Oslo since the beginning of 1934 with regard to the treatment of gastric haemorrhage. In the author's department of this hospital 113 patients were treated for haematemesis or melaena. Of the fourteen deaths as many as seven were traced to cirrhosis of the liver. The remaining seven patients suffered from gastric ulcer and five of them were over 50, two being over 70. The practice has been adopted during the past year of estimating the urea content of the blood in every case of gastric haemorrhage and Ustvedt has almost invariably found the concentration of urea in the blood above normal in many cases very much so. It is probable that this uraemia is in most cases of extrarenal origin—a condition described by the French as *azotémie par manque de sel*. The author's own experience and the literature agree on the influence of age on the mortality: very few patients dying of gastric haemorrhage under 40 and most being over 60 at the time of death. Age also plays a part in the choice of treatment: the older the patient the more likely is he to suffer from complicating ailments contraindicating an operation. The author's own attitude to operative treatment is very reserved and he concludes that in very few cases should a gastric haemorrhage require an operation. Only in one of his cases that of a man aged 31, who died of a large duodenal ulcer after two blood transfusions might an operation conceivably have saved life.

340

Myalgia and Infection

M. CLAMANN (*Med Welt* March 6, 1937, p 313) points out that myalgia is not a sharply defined clinical entity. He understands by this term sudden acute attacks of muscular pain—for example lumbago. The sudden and inextinguishable onset of pain following an ordinary movement is the characteristic symptom of the condition. An increased sensibility to pain must be present in order to give a pathological reaction to a normal stimulus. Clamann is convinced that this is due to infection. From careful observations on himself and his patients he states that myalgia occurs usually in the presence of infection which should be looked for. Thus cervical and lumbar myalgia may arise in the course of an acute infection of the tonsils and nasopharynx appearing before, during or after such an infection. The apparently acute onset of pain is due to faulty observation. The acute attack is preceded by a number of lesser often unnoticed, pains in the muscles. There is usually then a painless interval followed by the acute attack. Myalgia may remain in the 'prodromal' stage as one link in a chain of non specific symptoms of acute infection. Not only is the sensibility changed but also the muscular motility, as shown by facial expression, tired demeanour, lassitude, etc. Myalgia appears as the primary disease when pain overshadows the clinical picture of infection. Conversely it appears as secondary when acute infection overshadows the picture. Clamann admits that climate, alcohol, muscle activity and psychic depression are also aetiological factors but he believes that they are only secondary to infection.

341

Some Forms of Meningitis

B. A. PHOTAKIS (*Z. Tuberk. Bd 77 Heft 3, 1937, p 177*) states that a number of cases of meningitis cannot be attributed to any aetiological factor. The majority are secondary to some primary infectious focus in the body. The author describes four types he has met: (1) Meningitis occurring in the course of acute or chronic infectious diseases of a serous or sero-fibrinous type with typical symptoms. (2) Cases of chronic phthisis occur in which tubercles are found in the meninges and in which (a) meningeal symptoms have been present and (b) have not been present before death. Of sixty-nine post-mortems twenty-two belonged to group (a) eight to group (b). Photakis is convinced that tuberculous meningitis stated to be always fatal is recovered from in a small percentage of cases or passes into an abortive chronic form. Relapses occur from a flaring up of latent foci. Meningeal symptoms are recognized clinically only when the tubercles are active never when they are in an inactive chronic state. (3) There are cases of chronic phthisis in which although meningeal symptoms have been present no miliary tubercles are discovered in the meninges post mortem. Thus in a number of cases of phthisis a non specific meningitis arises but the patient recovers. The author shows that the diagnosis of tuberculous meningitis is too often made on the history of phthisis and meningitis and on the finding of bacilli in the cerebro spinal fluid. Non-specific meningitis may be accompanied by meningeal symptoms: turbid fluid, lymphocytosis and lowered glycogen content. Only the finding of miliary tubercles in the meninges at necropsy allows of a positive diagnosis.

342

Narcosis in Graves's Disease

E. FENZ (*Wien Arch inn Med* February 28, 1937, p 15) has investigated the basal metabolism of healthy individuals and of patients suffering from Graves's disease treated with large doses of veronal (0.5 gramme three times a day for three days) and of prominal (0.2 gramme three times a day for three to seven days). In healthy individuals the treatment produced only a slight decrease in the basal metabolism whereas in Graves's disease the decrease was very pronounced during the administration of the drug and in a number of cases the rate of the basal metabolism even descended to normal. The re-

usually increased again a few days after the cessation of the action of the drug. The excretion of water as ascertained by the Volhard test was very copious before the treatment, but decreased during it. In the majority of cases of Graves's disease the blood sugar curves were of the insulin resistant type but under the influence of the narcotics the resistance to insulin decreased. The drug also produced changes in the values of blood cholesterol, blood carotin and in the alkali reserves. There was a definite decrease of the excitability, a decrease of the pulse rate and in a few cases a decrease of the thyroid swelling but the exophthalmos remained unchanged. The author suggests the use of these narcotics as a preliminary to surgical operation. The favourable action of the drug may be explained either by a decreased activity of the thyroid through the inhibition of the diencephalon under the influence of the drug or through a decrease of the sensitiveness of the diencephalon to thyrotoxin.

Surgery

343 Subcutaneous Rupture of the Tendo Achillis

L. DEJARDIN and A. VAN RENTERGHEM (*Bruit méd* February 7 1937 p 545) point out that subcutaneous rupture of the tendo Achillis is comparatively rare, and describe fully several personal cases. The immediate cause of rupture is usually a fall or strain or some sudden movement of the leg or foot. Symptoms vary in different cases. There may be great pain with complete loss of function but in some instances pain is only slight and the patient is able to walk without much difficulty. In two cases reported the rupture was accompanied by a noise similar to the breaking of a cord. In recent cases there was swelling, ecchymosis, and limitation of movement in the foot particularly of extension. In cases of long standing there was rapid fatigue limitation of movement and the presence of a gap in the tendon at the site of rupture. It is of the greatest importance that operation which is the only satisfactory method of treatment should be carried out as soon as possible. By this means it is possible to clear out the haematoma and restore the continuity of the ruptured tendon. The operative active mobilization can take place at an early date thus preventing the formation of adhesions. The drawing technique which is fully described, consists of the ends together by light traction of the ruptured ends and suturing with silk and fine catgut. Occasionally a graft may be necessary if the ends cannot be brought together satisfactorily. In the cases described the functional result was good and in one instance walking was possible at the end of a fortnight. It is suggested that in cases in which there is no obvious cause for the rupture some condition such as diabetes, syphilis or overdevelopment of the leg muscles may be a contributory factor in producing the lesion.

344 Facial Injuries in Motor Accidents

C. STRAITH (*Rev. Chir. structure* December 1936 p 403) divides the facial injuries resulting from motor accidents into two groups: those which occur to the driver and those suffered by the passenger. As the driver is protected by the steering wheel he frequently emerges without injury but if he releases his hold on the wheel his injury usually consists of laceration and contusion of the chin associated with fractures of the mandible or damage to the upper jaw. Usually the passenger in front receives the worst injuries with fractures and depressions of the maxilla and malar bones or involvement of the orbit and eyeball. The procedure to be carried out consists of careful inspection and cleansing of all wounds and removal of foreign bodies. Hurried closure of wounds with skin clips and heavy suture materials is to be condemned. Cleansing must be followed by careful pal-

pation of all facial bones: separation of the malar attachments, depressions and eversions of the zygoma and depressed malar fragments at the infra-orbital foramen may thus be detected. Anaesthesia of the lateral surface of the nose and upper lip on the affected side is a frequent finding in these fractures. Palpation of the nose followed by inspection of the oral cavity to detect maxillary lesions, displacement of the maxilla caused by transverse fracture or midline or unilateral maxillary mandibular fractures or fractures of the necks of the condyles may be suspected. Severed portions of skin should be replaced and sutured then covered by a pressure dressing. After the wound has been cleansed and the skin edges trimmed buried dermal sutures are placed to relieve tension. The surface is approximated with a subcuticular horse hair suture, which may be removed in forty-eight hours. Simple nasal fractures can be corrected by thumb pressure under local anaesthesia but nasal bones that are torn loose from the frontal bone must be wired in position. The treatment of other fractures of the facial bones is fully described but emphasis is laid on the fact that no plastic procedure should be undertaken until two months after all traces of infection have disappeared.

Therapeutics

Pellagra and Polyneuritis

345

S. PETRI and O. WANSCHER (*Acta med. scand.* March 16, 1937 p 370) report from a hospital in Copenhagen their observations on five patients suffering from pigmentation of the skin, stomatitis, psychic disturbances and polyneuritis and treated with human gastric juice or preparations of hogs stomach. The human gastric juice was obtained by Ewald's test meals and was filtered through cotton immediately after removal from the stomachs of normal and hyperchylous persons not suffering from tuberculosis. The preparations of hogs stomach were obtained by alcohol treatment and desiccation. During the experiments the patients received no other treatment. Three of them suffered from alcoholic polyneuritis with mental disturbances and one from chronic achylia. Although the stomach preparations were given in small quantities and over a short period their effect on almost all the symptoms was surprisingly rapid. The general condition also improved rapidly and there was a considerable gain of weight. The achylia was not affected and there was little or no change in the blood picture. The authors conclude that the administration by the mouth of stomach preparations is so effective in pellagra that the condition may be due to a deficiency or absence of a substance normally existing in the stomach. Their experiments on animals confirm this opinion.

346 Blood Transfusion in Pulmonary Tuberculosis

P. BOURGEOIS, H. GISELBRESCH and S. COMMERSOY TEYSSIER (*Rei. Tuberc.* February 1937 p 150) review their experiences during eighteen months with seventy blood transfusions in cases of pulmonary tuberculosis in a sanatorium. No difficulty was experienced in finding donors nor did any accident from faulty technique occur. The authors do not consider this treatment indicated as an anodyne placebo for hopeless cases in which it may hasten rather than delay death. It should not be attempted when the patients are cachectic, when for several weeks their temperatures have oscillated wildly or when the extent of the pulmonary lesions is such that there is no hope of recovery. But there is a strictly limited field of usefulness for this treatment in other than certain cases of haemoptysis provided the recuperative capacity is not grossly impaired. In such patients blood transfusion repeated every ten or fifteen days for some time

may have a beneficial effect, transfusions of only 100 ccm being sufficient. The three main indications for this treatment are profuse haemorrhages, recurrent haemorrhages, and inability on the part of the patient to benefit from other standard methods of treatment. The authors classify their cases according as the results of this treatment were good, bad, or indifferent, and they recommend it only to those physicians who are prepared to employ it with strict discrimination. Its beneficial psychic effects are far from negligible.

347 Insulin-depot Therapy

G KATSCH and K KLATT (*Med Klinik* March 12, 1937, p 369) describe the advantages and the technique of administration of insulin-durante, which when injected in the gluteal muscles forms a depot of insulin. This depot is absorbed slowly and gradually so that injections may be given every twenty four, forty-eight, or seventy two hours according to the severity of the diabetes. Insulin durante consists of insulin incorporated in a mixture of lipoids. Certain substances are added to the preparation to delay its absorption by the blood stream. The same principle of preparation and administration has been applied to a number of other drugs, such as morphine, atropine, scopalamine etc.

Laryngology

348 Sphenoid Osteomyelitis

L J LAWSON (*Arch Oto laryng* Chicago January 1937 p 1) reports two cases of osteomyelitis of the sphenoid bone. A child aged 6 had a bilateral otitis media with mastoid abscesses. Both mastoid regions were opened and drained. Two weeks after apparent cure there was a recurrence of otitis on the left side with diplopia and headache. Ten days later a rapidly fatal basal meningitis developed. Necropsy revealed osteomyelitis of the sphenoid bone, produced by an extension from an osteomyelitis of the apex of the left petrous bone. A woman aged 33 had acute middle-ear suppuration on the right side with very severe pain. The discharge of pus from the meatus remained profuse for four and a half weeks. Then a thorough mastoidectomy was performed. Some three weeks after apparent recovery there was a sudden change for the worse. The first diagnosis was meningitis but this was later changed to thrombophlebitis of the large neck veins and septicaemia. Multiple skin incisions were made for the drainage of deep cervical abscesses in the posterior part of the neck. The right jugular and facial veins were tied but these operations did not save the patient. Necropsy showed osteomyelitis of the sphenoid bone. The usual complications of this are either basal meningitis or thrombosis of the cavernous sinuses. Neither of these developed but the process took the unusual outlet of posterior cervical thrombophlebitis with abscess formation and late septicaemia. Osteomyelitis of the sphenoid bone is rare because the pattern of the blood supply within the red bone marrow accounts for a unique ability to defend itself against invasion by organisms a property possessed to a lesser extent by the petrous apices (Eagleton). When osteomyelitis of the sphenoid does occur it requires extensive surgical removal of the bone beyond infected thrombosed blood vessels. This is not possible by any present-day technique.

349 Early Laryngeal Tuberculosis

N RH BLEGVAD (*J Laryng* March 1937, p 153) gives statistics of 1773 cases of laryngeal tuberculosis. The treatment practically always begins with universal carbon arc light baths as inaugurated by the Finsen Institute. In the last few years the author has also used quartz light baths. If there is no appreciable improvement

within a few months a local operation is done by the indirect method—for example, galvano cauterization, amputation of the epiglottis injection of alcohol into the superior laryngeal nerve or resection of this nerve. In most textbooks on laryngology it is stated that phthisical patients who are susceptible to acute laryngitis are especially disposed to laryngeal tuberculosis. Blegvad is convinced that this belief is wrong and based entirely on theoretical considerations. In the diagnosis of early laryngeal tuberculosis Blegvad lays stress on the following six signs: (1) Isolated redness of a vocal cord, if found in a phthisical patient is a fairly certain sign. The redness resembles a catarrhal affection but is actually tuberculous from the beginning. (2) Swelling and redness of both vocal processes which closely resembles ordinary pachydermia but differs from pachydermia because there is no swelling of the interarytenoid region. (3) Prolapse of the ventricle of Morgagni, which seldom consists in an eversion of the mucous membrane of the ventricle but is a swelling of the mucous membrane of the false vocal cords. The prolapse appears as a long red swelling along the outer edge of the vocal cord either on one or on both sides. Prolapse disappears more or less during phonation, and is most prominent during complete abduction of the vocal cords. (4) There is swelling of the lower surface of the vocal cords. (5) Swelling of the mucous membrane in the interarytenoid region is seen. The author has invented a special back-wall mirror which can be guided down between the vocal cords and displays the interarytenoid region. The image thrown on the small mirror is reflected on to a second laryngeal mirror placed in the usual position. (6) A red cushion appears beneath the commissure.

350 Otogenous Septicaemia in Infants

It is well recognized as B KARBOWSKY (*Ann Oto laryng* December, 1936, p 1230) points out that epidemic vomiting and diarrhoea affecting infants in the late summer and early autumn are often associated with signs indicative of middle-ear inflammation. Many writers maintain that these serious intestinal disturbances in infants are caused by the active or latent middle-ear suppuration. Others believe that the rapid dehydration of the body due to the diarrhoea leads to a diminished resistance and secondary infection of the tympanic cavity. The author undertook a histological study of temporal bones obtained from fatal cases in order to decide what part the middle-ear inflammation plays in the syndrome. There are three possibilities: (1) The middle-ear infection occurs just before death and has little significance. (2) The middle-ear infection is the primary cause of the illness. (3) The middle-ear infection is a complication of the general toxic state. The first hypothesis may be dismissed because signs of middle-ear inflammation have been observed too often during life and many infants have derived great benefit from paracentesis of the tympanic membrane. In some of the fatal cases no pus was found in the tympanic cavity, but the histological examination showed foci of suppuration in the substance of the petrous and mastoid bones pointing to a blood-borne infection rather than to an invasion via the Eustachian tubes. Other histological sections showed foci of thrombophlebitis and small abscesses immediately adjoining the jugular bulb. Such observations may be used in supporting either the second or the third hypothesis. The following explanation of the pathology is probably the correct one. The general infection is caused by an organism of the influenzal group. When the resistance of the patient is sufficient the otitis which is a secondary manifestation of the general infection goes on to suppuration. After incision of the tympanic membrane the infants recover from the ear symptoms as well as from the gastro-intestinal disturbance. On the other hand when the resistance is low the temporal bone foci and more particularly the septic thrombi of small bone veins near the

jugular bulb, become the dangerous factor in the clinical picture. The infants then die of a blood invasion from the ear region.

351 Diathermy Coagulation of the Tonsils

E. MOSER (*Zbl Chir* February 20, 1937, p 458) strongly advocates diathermy coagulation of septic tonsils. The operation is simpler than tonsillectomy, there is less shock and hardly any post-operative pain. Diathermy coagulation can therefore be done even if patients are in a weak state. Two children with severe polyarthritis and obstinate fever were treated in this way with excellent results. After experiencing this treatment himself Moser decided that it was safe to try diathermy coagulation on out-patients and he has treated some ninety cases. Local anaesthesia is produced by painting the tonsils with a weak solution of decaine and subsequent injection of 0.5 per cent solution of tutocaine in three or four places around the tonsils. The author emphasizes that only one diathermy application is made in each tonsil—namely, in the part of the tonsil where the septic focus appears to be—and sometimes only one tonsil has to be treated. In some patients only one side is coagulated and the other side is done after an interval of seven to ten days. The portions of the tonsils which remain after the slough has separated are harmless and can be looked upon as healthy tonsil remnants.

Obstetrics and Gynaecology

352 Carcinoma of the Female Urethra

T. P. SPARKS, jun and W. H. PARSONS (*Urol cutan Rev* February 1937, p 157) who have collected 119 cases from the literature as well as a personal one in a patient aged 75 in whom the growth was successfully excised, state that carcinoma of the female urethra, though uncommon is not so rare as the number of reported cases would suggest. The ages of the patients ranged from 26 to 75, the average age being 54. Of the 119, fifteen survived three or more years after treatment. Of forty received surgical treatment alone and of these two lived three years and one five years after operation. Of thirty treated by radium or deep x-ray therapy six survived three years or more and five were living at the end of five years. Of twenty one treated by a combination of some surgical procedure with radium or deep x-ray therapy seven lived three years or longer and five lived five years or longer after treatment. Of seventeen with inoperable glandular involvement only one survived. Six were treated by operation alone and none survived three years. Seven by radiation alone and none survived three years. Three by a combination of operation and radiation and two survived three years or longer. One nine years. One patient had no treatment. The prognosis in carcinoma of the female urethra is exceedingly poor though not hopeless. The authors conclude that desiderata for successful treatment are examination of all patients with painful micturition, early diagnosis of the malignant type and complete excision in the early stage.

353 Chorion Epithelioma and Hydatidiform Mole

B. ZONDEK (*J Amer med Assoc* February 20 1937 p 607) now writing from Jerusalem recalls that in hydatidiform mole and chorion-epithelioma the production and excretion of gonadotropic substance may be immensely increased so that huge amounts appear in blood, urine and spinal fluid. The significance of hormone tests in hydatidiform mole is dependent on the exclusion—which clinically should be easy—of a pregnancy toxæmia in which almost equally large amounts may be excreted. If a positive luteinizing reaction (Grade III in the Zondek

Asehheim test) is given by the spinal fluid hydatidiform mole may be diagnosed. If the pregnancy test remains positive six weeks after the discharge of a mole and if the urinary gonadotropic hormone has progressively increased, chorion epithelioma is probable—especially if a positive reaction is found in the spinal fluid. If after hydatidiform mole the pregnancy test, at first negative, later becomes positive a chorion epithelioma is possible, but it is very important to remember that there may be a new pregnancy. The presence of at least 416 mouse units of luteinizing factor per litre of urine points to chorion-epithelioma if a second pregnancy can be excluded. In chorion epithelioma the urine usually contains much more than such a content of luteinizing hormone—up to 1,000,000 units per litre. The hormone assay of the urine is of great prognostic importance after operation for chorion-epithelioma. Clinical improvements are often deceptive and a return of luteinizing substance in the urine points to an early metastasis—for example in the lung. Zondek confirms the apparently paradoxical finding that in normal pregnancy as well as chorion epithelioma the anterior pituitary contains little or no gonadotropic hormone.

Pathology

354 The Sedimentation Test in Tuberculosis and Syphilis

F. SCHEIDEMANDEL (*Disch Tuberkul* March 1937, p 69) has found in an institution serving as a clearing station for definite and doubtful cases of tuberculosis that the rate of sedimentation of the erythrocytes is a valuable guide to differential diagnosis although this test is not specific but is merely indicative of inflammatory and destructive changes in the body. He gives details of four cases common to which were little or no radiological evidence of active pulmonary tuberculosis. In doubtful clinical signs of active pulmonary tuberculosis, tuberculin reaction, of it a negative intracutaneous tuberculin reaction, positive Wassermann reaction and a remarkably high rate of sedimentation. The contrast between this high rate and the negative findings on radiological and physical examination of the chest was striking. This experience has taught the author to require a Wassermann test whenever the findings of the sedimentation test could not be accounted for by reference to pulmonary tuberculosis and in the course of the last two years he has, by taking this precaution been able to provide anti-syphilitic treatment for seventeen patients the nature of whose disease had not previously been recognized. A rapid rate of sedimentation may well be due to untreated secondary syphilis whereas in tertiary syphilis this rate is comparatively slow. Indeed, it is almost normal in latent forms of syphilis in which the Wassermann reaction is negative. When it is positive but the syphilis is latent the sedimentation rate is only slightly raised. When a tuberculous process is slight and scarred and is not calculated to have any effect on the rate of sedimentation a high rate should raise suspicions of Wassermann positive syphilis running a more or less latent course.

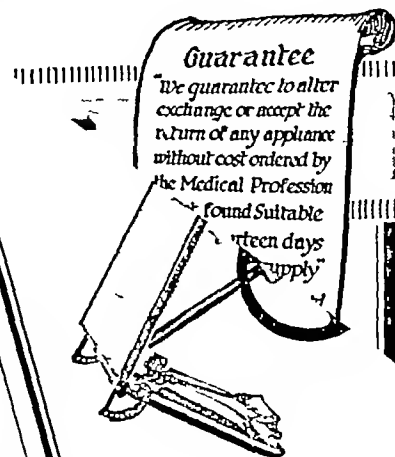

Fatal Bleeding

355

S. M. LEITESS (*Arch Sci Biol* 1936 vol 41 p 133) has investigated the distribution of blood in the different blood vessels following profuse bleeding. Bleeding from the aorta causes more rapid death than bleeding from the femoral artery although more blood is lost in bleeding from the latter. The blood content of the brain and other internal organs is high following bleeding from the aorta but is low following bleeding from the carotid artery. There is no relation between the blood contents of the brain and of the other internal organs. In the brain itself the distribution of the blood varies from one part to another: the medulla and pons usually contain little blood while much blood is found in corpora quadrigemina.

SALTAIR SURGICAL SERVICE

CORRECTIVE EFFICIENCY IS JOINED WITH GOOD STYLE IN SALT'S SACRO-ILIAC CORSETS

Many lady patients prefer Corsets to Belts, and, for this reason, SALTS produce Sacro-Iliac Corsets in practically any style desired—with or without Brassiere top. Whatever the style chosen, the efficiency of the Corset is always the same. Continuous, equable and firm pressure is given to the pelvic girdle, approximating the subluxated components of the articulation. There are four qualities, priced to suit different classes of patient.

SALT'S CORSET AND BELT BOOK gives details of these. A copy will be sent free and post free to any Doctor upon application.

An important feature of the above mentioned book is the time saving Measure / Order form found opposite the description of each Appliance.

THE IDEAL ANTACID

Magnoleum is an emulsion of liquid paraffin and magnesium hydroxide prepared entirely by mechanical means without the aid of any constipating mucilaginous emulsifying agents. Its action is that of its active ingredients in an extremely fine state of sub-division. Being perfectly

miscible with water or milk it may be diluted before taking given to bottle-fed infants in food etc. It is readily acceptable to children and delicate or fastidious adults. Issued in convenient wide mouthed glass bottles 1/3 and 2/6. Write for specimen for clinical trial.

MORE THAN £7,000

*spent on improved
equipment for*

The CLINIC

in 1936....

The successful operation of The Clinic during 1936 resulted in a sum of more than £7,000 "on the right side." The whole of this amount was put back into The Clinic in the form of additional and improved equipment and facilities. Thus the Clinic carries into practical effect the policy embodied in the operating Company's Constitution that all surplus revenue must be devoted to the furtherance of its objects.

All the facilities and services of The Clinic are at the disposal of any Practitioner on the register of the

General Medical Council. The average charge for a room in The Clinic—undoubtedly the finest Nursing Home, from every point of view, in the British Empire—is no more than 14 guineas per week, and there are frequently rooms obtainable on which the rates are as little as 10 guineas. All room rates now include a free dispensary service—an "extra" which cost The Clinic nearly £2,000 last year. Enquiries and visits from the medical profession are always welcome. Write for full details to the Secretary.

President, VISCOUNT WAKEFIELD OF HYTHE G.C.V.O.
Treasurer, SIR LIONEL FAUDEL PHILLIPS Bart
Physician Supt. J. G. PORTER PHILLIPS M.D. F.R.C.P.

This Registered Hospital is now situated at Monks Orchard in some 250 acres of park, pleasure and farm grounds. Applications can be considered on behalf of patients of the educated classes in a presumably curable condition. With a view to early treatment voluntary or uncertified patients are admitted. Patients who can contribute 5 guineas weekly towards the cost of treatment and maintenance may be received as vacancies arise. The Committee will also consider applications for admission at lower rates and in certain cases will be prepared to admit patients free of charge.

Every facility for specialised investigation and treatment is provided in the Lord Wakefield Science and Treatment Unit. In this unit is found X Ray and Dental Departments and the Bio-Chemical Pathological and Psychological Laboratories. Furthermore provision is made for Electro-Therapy and Hydro-Therapy to be carried out in all their forms and Occupational Therapy under competent instruction is encouraged.

In addition to the Resident Medical Staff, Consultants in special branches of medicine and surgery are available whenever required. The comfort of sensitive patients is greatly enhanced by the fact that the majority are given single bedrooms. For forms and further particulars apply to the Physician Superintendent at the Hospital.

NEW LODGE CLINIC, WINDSOR FOREST

This Clinic was founded in 1921 in order to provide for the scientific investigation and treatment of disease by a team of physicians and specialists.

All forms of non-infectious medical cases are admitted, special attention being paid to disorders of digestion and metabolism arthritis anaemias asthma, heart and kidney disease and functional and organic nervous disorders. Particulars can be obtained on application to the Secretary New Lodge Clinic, Windsor Forest Berks.

RHEUMATIC DISEASES

DROITWICH

The need for an English Spa, pleasantly situated, with all the facilities for the treatment of rheumatic diseases offered by the famous Continental spas, has long been felt. This Droitwich now supplies, and more and more cases which formerly would have been sent abroad are now going to Droitwich. The natural brine which rises at Droitwich is the most potent of its kind in Europe and it has worked many remarkable cures.

SPA

In addition to the three main baths there are Reclining Baths, Douche Spray Baths, Air Douche, Aeration and Deep Chair Baths, and Nauheim Baths for the treatment of disorders accompanying maladies of the heart. Finely equipped X-Ray and Electro-Therapy departments offer facilities for research and treatments including Diathermy, Infra-Red, Ultra-Violet Rays, Galvanism, Faradism, Ionisation and High Frequency.

*A residential Clinic is maintained
for patients of moderate means*

MEDICAL CORRESPONDENCE COLLEGE

19 WELBECK STREET LONDON W 1
Tel. Welbeck 8901

PROVIDES HIGHLY SUCCESSFUL
ORAL AND POSTAL COACHING FOR
ALL MEDICAL EXAMINATIONS

Special Preparations for all Surgical Qualifications

FRCS ENGLAND M C CANTAB
(Primary & Final) MS LONDON
FRCS EDINBURGH

And all other Surgical Degrees and Diplomas

The remarkable success of Students of the Medical Correspondence College at the higher Surgical Examinations is specially noteworthy

Both at the Primary and Final FRCS England the majority of our Students are successful at the first attempt and Candidates who have failed at these Examinations on several previous occasions get through without difficulty after going through our courses

The Surgical Tutors of the College all hold either the MS Lond or FRCS England or both and are highly experienced teachers

The Postal Courses are thoroughly clear concise and up to date, and the test questions are carefully selected from those set at previous Examinations so as to embrace all parts of the subject. By working systematically through the Course the Student is brought up to the examination standard in the minimum time and much unnecessary reading is saved

Institute of Pathology and Research

ST MARY'S HOSPITAL, LONDON, W 2

A Course of Lectures on **PATHOLOGICAL RESEARCH IN ITS RELATION TO MEDICINE** has been arranged for the SUMMER SESSION. These Lectures will be given in the Lecture Theatre of the Bacteriological Department of the Institute, on **TUESDAY AFTERNOONS** at 5 p.m. The second and third lectures of the series will be the following —

MAY 4th

FRANCIS MARTIN ROUSE WALSHE MD
(Physician i/c Neurological Dept University
College Hospital)

SUBJECT

"Some General Principles in Neurological
Diagnosis"

Synopsis furnished by the lecturer —

The central nervous system is not accessible to any form of direct observation. Therefore the recognition of disease within it depends upon the finding and interpretation of disorders of function and structure in tissues innervated by it.

In this recognition the applied anatomy and physiology of the nervous system play an important part but since the disease process and the body's reaction are dynamic diagnosis depends not only upon the observation of signs at any given time but also upon a study of the sequence of events. There is a time factor as well as a spatial in clinical diagnosis.

Direct clinical study of the patient must precede pathological instrumental and surgical methods of diagnosis. Any other sequence is irrational and unsafe.

The study of physical signs has not only a practical usefulness but for the neurologist also an unsuppressed interest for the light it throws upon the normal functions of the nervous system. The maintenance of this second interest has always been a distinguishing feature of the English school of neurology.

MAY 18th

WILLIAM ROBIN THOMPSON
PhD DSc FRS
(Asst. Director The Imperial Institute of
Entomology)

The Biological Control of Insect and Plant
Pests (With Cinema film)

(The Synopsis furnished by the lecturer will appear in next week's advertisement.)

These Lectures are open to all members of the Medical Profession and to all Students in Medical Schools without fee.

QUEEN CHARLOTTE'S MATERNITY HOSPITAL

MARYLEBON ROAD, N.W.1

Medical Students and Qualified Practitioners admitted to the Practice of this Hospital. Unusual opportunities are afforded of seeing Obstetrical Complications and Operative Midwifery (about one half of the total admissions being primiparous cases). Over 700 patients are admitted to the Wards annually and in the Ante-natal Department there are over 6000 attendances per annum. Clinical demonstrations are given by the Staff daily.

For rules, fees, etc. apply to H. D. Stokes, Secretary-Superintendent.

CITY OF LONDON MATERNITY HOSPITAL

(Incorporated by Royal Charter)
CITY ROAD LONDON E.C.1

COUNTY BOROUGH OF CROYDON PUBLIC HEALTH DEPARTMENT

Appointment of DEPUTY MEDICAL OFFICER
OF HEALTH AND DEPUTY SCHOOL
MEDICAL OFFICER

Applications are invited from qualified Medical Practitioners for the appointment of a Deputy Medical Officer of Health and Deputy School Medical Officer.

Applicants must be medical men holding a special qualification in State Medicine or a Diploma in Public Health and must have had three years' experience of the practice of medicine since obtaining their medical qualification.

Preference will be given to applicants who (a) Have had some definite experience of School Medical work

(b) Have enjoyed special opportunities for the study of Diseases in Children

(c) Have had experience in Infectious Diseases

(d) Have held one or more Resident Hospital appointments and

(e) Have held or are holding a position as Assistant Medical Officer of Health elsewhere.

The candidate appointed will be required to produce a recent satisfactory medical certificate of health and to devote the whole of his time to the duties of the office.

The minimum salary will be £70 per annum. The post is an established post under the Local Government and Other Officers Superannuation Act 1928.

Applications to be made on forms to be obtained by sending a stamped addressed foolscap envelope to the Medical Officer of Health, Public Health Department, Town Hall, Croydon, to whom they should be returned accompanied by copies (not originals) of not more than three testimonials of recent date not later than 10 a.m. on Wednesday May 19th 1937, endorsed "Deputy Medical Officer of Health, Croydon" in any form is prohibited.

April 26th 1937

SURREY COUNTY COUNCIL

Boileys Park Colony (Certified Institution for Mental Defectives) near Chertsey, Surrey

APPOINTMENT OF MEDICAL
SUPERINTENDENT

Applications are invited from registered Medical Practitioners (male) for the whole-time appointment of Resident Medical Superintendent at the above-mentioned Certified Institution. The first section of the Colony which is now in course of erection will provide accommodation for 1,200 patients and the necessary resident staff and will eventually provide 1,500 patients' beds. In addition there is accommodation for another 300 patients in an immediately adjacent institution which is under the same administration as the main colony. Commencing salary £1,000 rising by annual increments of £50 to a maximum of £1,375 per annum with emoluments valued for superannuation purposes at £125 per annum.

The appointment will be subject to the provisions of the Asylums and Certified Institutions (Officers' Pensions) Act, 1915 and to the Council's Staffing Regulations. The person appointed will be required to undergo a medical examination and to commence his duties on October 31st 1937.

Applications stating age and whether married or single accompanied by copies of three recent testimonials must reach the undersigned not later than Monday May 24th 1937. The envelope should be marked "Boileys Park Medical Superintendent".

COUNTY BOROUGH OF WEST HAM

APPOINTMENT OF MEDICAL OFFICER OF
HEALTH AND SCHOOL MEDICAL OFFICER

Applications are invited from qualified medical men holding a Degree or in Diploma of Public Health for the appointment of Medical Officer of Health and School Medical Officer at a salary of £1,400 per annum rising by annual increments of £50 to a maximum of £1,750 per annum inclusive of all fees and emoluments.

Applicants must not be more than 45 years of age (except in respect of applications from persons already in the service of the Council) and be fully qualified to carry out and perform all the duties of Medical Officer of Health and School Medical Officer and appertaining to the medical services of the Council including those as Administrative Officer under the Mental Deficiency Acts and such other duties as may from time to time be prescribed by the Council.

The appointment will be subject to the approval of the Ministry of Health and the Board of Education, and will be terminable on three months' notice on either side. The person appointed will be required to devote his whole time to the duties of the office and to pay over to the Council all moneys received by him in connection with the appointment from whatever source such moneys are received.

The appointment will also be subject to the provisions of the Local Government and Other Officers' Superannuation Act 1928, and to a medical examination as required by the Council for the purposes of that Act and the statutory contributions to the Superannuation Fund under the Act will be deducted from the salary.

Applications on the form provided (which will be forwarded by the undersigned on receipt of a stamped addressed foolscap envelope) must reach me not later than June 11, 1937.

Canvassing members of the Council is prohibited and will be disqualified.

BRITISH MEDICAL ASSOCIATION

TAVISTOCK SQUARE

Two Specialist Publications of the B.M.A.

★ ARCHIVES OF DISEASE IN CHILDHOOD

This specialist publication covering the whole field of paediatrics is issued bi-monthly and contains original articles of great importance to those who are interested in this particular branch of medical practice

"Archives of Disease in Childhood" is printed on high quality paper which lends itself admirably to the reproduction of photographs illustrating the articles including radiographs

Yearly (Six Numbers), 25/ or 4/6 per copy

• The Journal of NEUROLOGY AND PSYCHOPATHOLOGY

The specialist in the neurological and allied branches of medical science will find in this quarterly publication articles contributed by the leaders of international thought regarding all kinds of mental conditions. Abstracts from world publications in the same field are also included

The Journal of Neurology and Psychopathology is printed in such a way as to enable the fullest benefit to be derived from the various illustrations in its pages

Subscription 30/ per annum or 8/6 per copy

Obtainable from B.M.A. House, Tavistock Square, London, W.C.1

SHOP WINDOWS

Who is not tempted to glance at the goods displayed in the shop windows which brighten the streets of every town? The subtle attraction of articles thus brought to notice cannot be explained by any immediate need to purchase. Indeed, the majority of the contents of shop windows have no immediate appeal. They are seen and a mental note is made which may well prove useful later on.

So it is with the advertisements in the *British Medical Journal*. Sometimes it is true, the reader searches these pages to find a particular preparation or appliance for use in the treatment of a specific case. More often the advertised products are noticed and remembered pending their being required at some future time.

In this way an up-to-date knowledge of proprietary aids to medical practice can be maintained without expense and with very little expenditure of time.

Two helpful suggestions. Pages may be cut out and filed for future reference and it is always worth while to mention the B.M.J. when writing to advertisers.
